GCE Subject Level Conditions and Requirements for Geology

May 2016

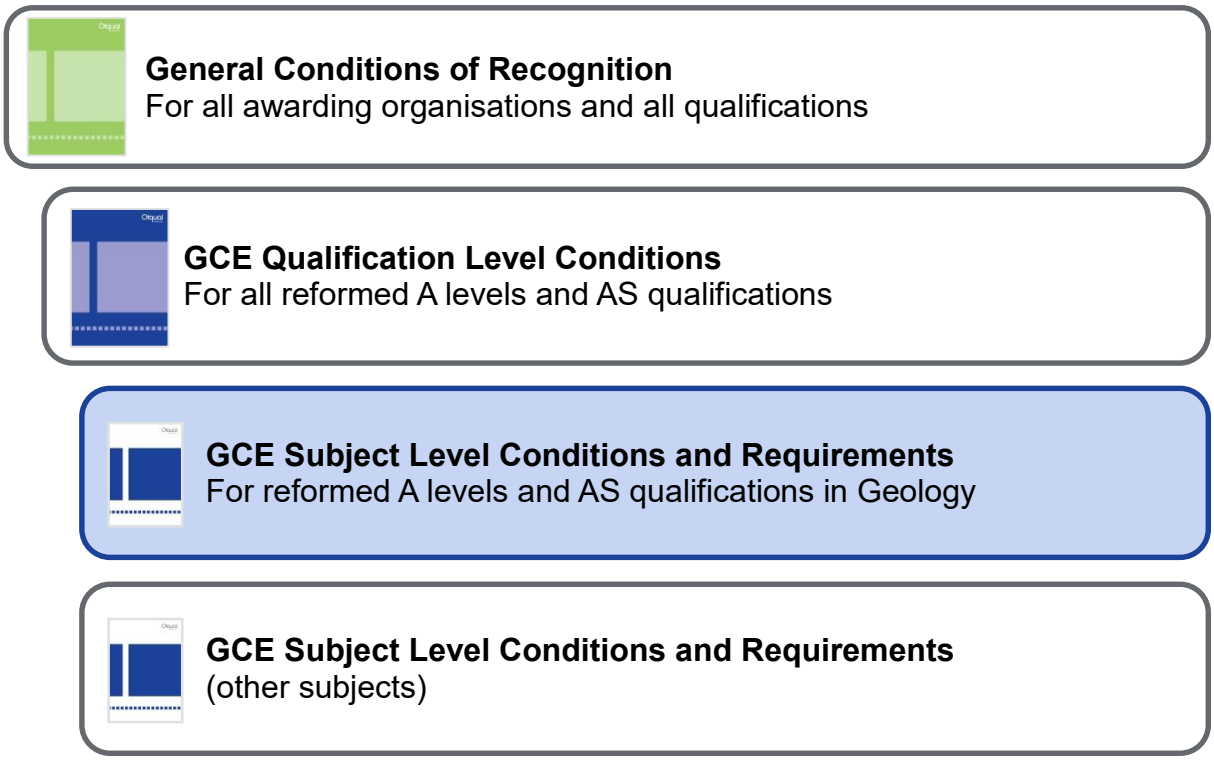
Ofqual/16/6010

Contents

Introduction

About this document

This document (highlighted in the figure below) is part of a suite of documents which sets out the regulatory requirements for awarding organisations offering reformed A levels and AS qualifications.



We have developed all our requirements for GCE qualifications with the intention that AS and A level qualifications should fulfil the purposes set out in the table below:

A levels	AS qualifications
■ define and assess achievement of the knowledge, skills and understanding which will be needed by students planning to progress to undergraduate study at a UK higher education establishment, particularly (although not only) in the same subject area; ■ set out a robust and internationally comparable post-16 academic course of study to develop that knowledge, skills and understanding;	■ provide evidence of students' achievements in a robust and internationally comparable post-16 course of study that is a sub-set of A level content; ■ enable students to broaden the range of subjects they study.

■ permit UK universities to accurately identify the level of attainment of students; ■ provide a basis for school and college accountability measures at age 18; and ■ provide a benchmark of academic ability for employers.	

Requirements set out in this document

This document sets out the GCE Subject Level Conditions for Geology. These conditions will come into effect at 5.01pm on Friday 27 May 2016 for the following qualifications:

- all GCE A levels in Geology awarded on or after 1 April 2019; and
- all standalone GCE AS qualifications in Geology awarded on or after 1 April 2018.

It also sets out our requirements in relation to:

- assessment objectives – awarding organisations must comply with these requirements under Condition GCE(Geology)1.2;
- requirements in relation to practical skills assessments – awarding organisations must comply with these requirements under Condition GCE(Geology)4.2; and
- certificate requirements – awarding organisations must comply with these requirements under Condition GCE(Geology)6.3 and General Condition I3.1.

Appendix 1 reproduces the subject content requirements for Geology, as published by the Department for Education.[1] Awarding organisations must comply with these requirements under Condition GCE(Geology)1.1.

With respect to the qualifications listed above, awarding organisations must also comply with:

[1] www.gov.uk/government/publications/gce-as-and-a-level-geology

- our *General Conditions of Recognition*,[2] which apply to all awarding organisations and qualifications;
- our *GCE Qualification Level Conditions and Requirements*;[3] and
- all relevant Regulatory Documents.[4]

With respect to all other GCE qualifications in Geology, awarding organisations must continue to comply with the General Conditions of Recognition, the *GCE Qualification Level Conditions*,[5] and the relevant Regulatory Documents.

Summary of requirements

Subject Level Conditions	
GCE(Geology)1	Compliance with content requirements
GCE(Geology)2	Assessment
GCE(Geology)3	Practical skills
GCE(Geology)4	Practical skills assessments
GCE(Geology)5	Fieldwork statements
GCE(Geology)6	Marking and results

GCE AS and A level Subject Content for Geology

Subject Level Conditions

GCE Subject Level Conditions for Geology

Condition GCE(Geology)1	Compliance with content requirements
GCE(Geology)1.1	In respect of each GCE Qualification in Geology which it makes available, or proposes to make available, an awarding organisation must – (a) comply with the requirements relating to that qualification set out in the document published by the Secretary of State entitled 'Geology GCE AS and A level subject content',[6] document reference DFE-00056-2016, (b) have regard to any recommendations or guidelines relating to that qualification set out in that document, and (c) interpret that document in accordance with any requirements, and having regard to any guidance, which may be published by Ofqual and revised from time to time.
GCE(Geology)1.2	In respect of each GCE Qualification in Geology which it makes available, or proposes to make available, an awarding organisation must comply with any requirements, and have regard to any guidance, relating to the objectives to be met by any assessment for that qualification which may be published by Ofqual and revised from time to time.

[6] www.gov.uk/government/publications/gce-as-and-a-level-geology

Condition GCE(Geology)2	Assessment
GCE(Geology)2.1	An awarding organisation must ensure that in respect of each assessment for a GCE Qualification in Geology which it makes available it complies with any requirements, and has regard to any guidance, which may be published by Ofqual and revised from time to time.

Condition GCE(Geology)3 **Practical skills**

GCE(Geology)3.1 In respect of each GCE A level qualification in Geology which it makes available, or proposes to make available, an awarding organisation must –

(a) require each Learner to complete at least 12 practical activities, and

(b) ensure that, taken together, those practical activities provide opportunities for each Learner to –

(i) develop all of the skills specified in appendix 1a to the content document, and

(ii) use and be assessed in relation to all of the skills, apparatus and techniques specified in appendices 1b and 1c to the content document.

GCE(Geology)3.2 In respect of each GCE A level qualification in Geology which it makes available, or proposes to make available, an awarding organisation must –

(a) review the practical activities which it requires each Learner to complete following any revision by the Secretary of State to the specified skills, apparatus or techniques, and

(b) revise those practical activities if appropriate.

GCE(Geology)3.3 In respect of each GCE A level qualification in Geology which it makes available, or proposes to make available, an awarding organisation must –

(a) set out in the specification for that qualification –

(i) the practical activities which each Learner must complete, and

(ii) in particular, the skills and techniques which those practical activities must allow each Learner to develop or demonstrate, and the apparatus which those practical activities must allow each Learner to use, and

(b) promptly amend that specification when the awarding organisation makes any revision to those skills, techniques or apparatus, or those practical activities, and

(c) where such an amendment has been made to the specification, publish that specification as amended.

GCE(Geology)3.4 In respect of each assessment cycle for each GCE A level qualification in Geology which it makes available, an awarding organisation must –

(a) require each Centre to provide a practical skills statement to the awarding organisation, and

(b) treat any failure by a Centre to provide a practical skills statement to the awarding organisation in a timely manner as malpractice and/or maladministration (under General Condition A8 (*Malpractice and maladministration*)).

GCE(Geology)3.5 For the purposes of this condition, the content document is the document specified in Condition GCE(Geology)1.1(a).

GCE(Geology)3.6 For the purposes of this condition, a 'practical skills statement' is a true and accurate written statement made by a Centre to an awarding organisation which confirms that it has taken reasonable steps to secure that each Learner to whom that Centre has delivered the assessments to be taken in a particular assessment cycle for each A level qualification in Geology which the awarding organisation makes available has –

(a) completed at least 12 practical activities as required by the awarding organisation, and

(b) made a contemporaneous record of the work which that Learner has undertaken during those practical activities.

Condition GCE(Geology)4 — Practical skills assessments

GCE(Geology)4.1 In respect of each practical skills assessment for a GCE A level qualification in Geology that an awarding organisation makes available or proposes to make available –

(a) Condition H2 does not apply,

(b) Condition GCE4.1 does not apply, and

(c) that assessment must not be an Assessment by Examination.

GCE(Geology)4.2 For the purposes of this condition, a 'practical skills assessment' is an assessment –

(a) of a Learner's competency in the skills outlined in appendix 1b, and the use of the apparatus and techniques outlined in the relevant portions of appendix 1c, to the document published by the Secretary of State entitled 'GCE AS and A level subject content for geology'[7], document reference DFE-00056-2016,

(b) as evidenced by the Learner's performance in at least 12 practical activities as required by the awarding organisation under Condition GCE(Geology)3.1.

[7] www.gov.uk/government/publications/gce-as-and-a-level-geology

Condition GCE(Geology)5	Fieldwork statements
GCE(Geology)5.1	In respect of each assessment cycle for a GCE Qualification in Geology which it makes available, an awarding organisation must – (a) require each Centre to provide a fieldwork statement to the awarding organisation, (b) treat any failure by a Centre to provide a fieldwork statement to the awarding organisation in a timely manner as malpractice and/or maladministration (under General Condition A8 (*Malpractice and maladministration*)).
GCE(Geology)5.2	For the purposes of this condition – (a) a 'fieldwork statement' is a true and accurate written statement made by a Centre to an awarding organisation which confirms that each Learner to whom that Centre has delivered the assessments to be taken in a particular assessment cycle for a GCE Qualification in Geology which the awarding organisation makes available has been provided with reasonable opportunities to undertake geological fieldwork, and (b) 'geological fieldwork' is fieldwork which meets the requirements set out in appendix 1, as relevant, to the document published by the Secretary of State entitled 'GCE AS and A level subject content for geology', document reference DFE-00056-2016[8].

[8] www.gov.uk/government/publications/gce-as-and-a-level-geology

Condition GCE(Geology)6	**Marking and results**
GCE(Geology)6.1	In respect of each GCE A level qualification in Geology which it makes available an awarding organisation must calculate and publish the following two separate results for each Learner – (a) a result for the Assessments by Examination to be taken for that qualification, and (b) a result for the practical skills assessment.
GCE(Geology)6.2	In respect of each GCE A level qualification in Geology which it makes available, an awarding organisation must ensure that an Assessor does not have any regard to a Learner's – (a) result for the practical skills assessment in calculating that Learner's final mark and result for the Assessments by Examination, and/or (b) final mark or result for the Assessments by Examination in determining that Learner's result for the practical skills assessment.
GCE(Geology)6.3	In respect of each practical skills assessment an awarding organisation must ensure that it complies with any Certificate Requirements in relation to that assessment which may be published by Ofqual and revised from time to time.
GCE(Geology)6.4	In respect of each GCE A level qualification in Geology which it makes available, an awarding organisation must ensure that – (a) a Learner may use the result for a practical skills assessment which he or she has taken for a GCE A level qualification in Geology made available by the awarding organisation or another awarding organisation, and (b) that Learner is not required to take a further practical skills assessment before being awarded the qualification.

GCE(Geology)6.5 For the purposes of this condition, a practical skills assessment has the same meaning as in Condition GCE(Geology)4.2.

Assessment requirements

Assessment requirements – GCE Qualifications in Geology

Condition GCE(Geology)2.1 allows us to specify requirements in relation to assessments for GCE Qualifications in Geology.

We set out below our requirements for the purposes of Condition GCE(Geology)2.1. Awarding organisations must comply with these requirements in relation to all GCE Qualifications in Geology they make available.

Mathematical skills

The subject content for GCE Qualifications in Geology is set out in the document published by the Secretary of State entitled 'Geology GCE AS and A level subject content', document reference DFE-00056-2016 (the 'Content Document').

Appendix 2 to the Content Document specifies the mathematical knowledge, skills and understanding which Learners will be required to use and apply in GCE Qualifications in Geology (the 'Mathematical Skills').

In designing and setting the Assessments by Examination for a GCE Qualification in Geology which it makes available, or proposes to make available, an awarding organisation must ensure that –

(a) questions and tasks rewarding the use of 'Mathematical Skills' assess those skills within the context of other areas of the subject content, and not in isolation,

(b) at least 10 per cent of the total marks for the qualification reward the use of Mathematical Skills at a Level of Demand which is not lower than that which is expected of Learners in assessments for the higher tier in a GCSE Qualification in Mathematics, and

(c) without prejudice to the above requirements and those outlined in the Content Document, in each set of assessments Mathematical Skills are assessed at a range of Levels of Demand which supports effective differentiation in relation to the qualification.

Assessment of Learners in relation to geological skills and techniques – indirect assessment

In designing and setting the Assessments by Examination for each GCE Qualification in Geology which it makes available, or proposes to make available, an awarding organisation must ensure that, taking those assessments together –

(a) Learners' knowledge, skills and understanding in relation to geological skills and techniques is assessed across assessment objectives AO1, AO2 and AO3,

(b) the number of marks used to credit such knowledge, skills and understanding is no less than 15 per cent of the total marks for the qualification,

(c) the questions and tasks which test Learners' knowledge, skills and understanding in relation to geological skills and techniques draw on, and combine as appropriate, the theoretical and technical aspects of those skills and techniques,

(d) for a GCE A level qualification, over the shortest period of time that is reasonably practicable, Learners are assessed in relation to all of the skills and techniques specified in appendix 1a to the Content Document, and

(e) for a GCE AS qualification, over the shortest period of time that is reasonably practicable, Learners are assessed in relation to all of the skills and techniques specified in appendices 1a and 1d to the Content Document, and to the relevant skills and techniques in appendix 1c to the Content Document.

Requirements in relation to practical assessments

Requirements in relation to practical skills assessments

Condition GCE(Geology)2.1 allows us to specify requirements and guidance in relation to assessments for GCE Geology Qualifications.

We set out our requirements in relation to practical skills assessments (as defined in Condition GCE(Geology)4.2) for GCE A level qualifications in Geology for the purposes of Condition GCE(Geology)2.1 below.

Form of the practical skills assessment

An awarding organisation must ensure that each practical skills assessment is designed and set in such a way as to allow a Learner who has demonstrated the competencies outlined in Table 1 below to reach a Pass.

Marking of practical skills assessments

Evidence generated by a Learner in a practical skills assessment may be marked –

(a) by a Centre,

(b) by the awarding organisation or a person connected to the awarding organisation, or

(c) through a combination of (a) and (b).

In any event, the awarding organisation must demonstrate to Ofqual's satisfaction in its assessment strategy that –

(a) it has taken all reasonable steps to identify the risk of any Adverse Effect which may result from its approach to marking practical skills assessments, and

(b) where such a risk is identified, it has taken all reasonable steps to prevent that Adverse Effect or, where it cannot be prevented, to mitigate that Adverse Effect.

The specified level of attainment in practical skills assessments

In relation to each practical skills assessment, an awarding organisation must ensure that –

(a) the only specified level of attainment is a Pass,

(b) the criteria used by Assessors to determine whether each Learner will be awarded a Pass are those set out in Table 1 below, and

(c) a Learner who does not meet the criteria to be awarded a Pass, or who has not been exempted on grounds of disability from the assessment but who does not take that assessment, is issued a result of Not Classified.

Under Condition H1.1, an awarding organisation must have in place arrangements to ensure that, as far as possible, the criteria set out in Table 1 are –

(a) understood by Assessors and accurately applied, and

(b) applied consistently by Assessors, regardless of the identity of the Assessor, Learner or Centre.

Table 1: The criteria for a Pass

In order to be awarded a Pass a Learner must, by the end of the practical skills assessment, consistently and routinely meet the criteria in respect of each competency listed below. A Learner may demonstrate the competencies in any practical activity undertaken as part of that assessment throughout the course of study.

Learners may undertake practical activities in groups. However, the evidence generated by each Learner must demonstrate that he or she independently meets the criteria outlined below in respect of each competency. Such evidence –

a) will comprise both the Learner's performance during each practical activity and his or her contemporaneous record of the work that he or she has undertaken during that activity, and

b) must include evidence of independent application of investigative approaches and methods to practical work.

Competency	**Assessment criteria**
1 – Follows written procedures	a) Correctly follows written instructions to carry out experimental techniques or procedures
2 – Applies investigative approaches and methods when using instruments and equipment	a) Correctly uses appropriate instrumentation, apparatus and materials (including ICT) to carry out investigative activities, experimental techniques and procedures with minimal assistance or prompting. b) Carries out techniques or procedures methodically, in sequence and in combination, identifying practical issues and making adjustments where necessary.

	c) Identifies and controls significant quantitative variables where applicable, and plans approaches to take account of variables that cannot readily be controlled. d) Selects appropriate equipment and measurement strategies in order to ensure suitably accurate results.
3 – Safely uses a range of practical equipment and materials	a) Identifies hazards and assesses risks associated with those hazards, making safety adjustments as necessary, when carrying out experimental techniques and procedures in the lab or field. b) Uses appropriate safety equipment and approaches to minimise risks with minimal prompting.
4 – Makes and records observations	a) Makes accurate observations relevant to the experimental or investigative procedure. b) Obtains accurate, precise and sufficient data for experimental and investigative procedures and records this methodically using appropriate units and conventions.
5 – Researches, references and reports	a) Uses appropriate software and/or tools to process data, carry out research and report findings. b) Cites sources of information demonstrating that research has taken place, supporting planning and conclusions.

Monitoring of practical skills assessments

In respect of each GCE A level qualification in Geology which it makes available, an awarding organisation must have in place clear and effective arrangements to monitor the delivery and, where relevant, the marking of practical skills assessments by Centres.

As part of those arrangements, an awarding organisation must ensure that each Centre which delivers practical skills assessments receives a monitoring visit at least every two years (a 'Monitoring Visit').

An awarding organisation must ensure that each Monitoring Visit it conducts includes the following activities –

(a) Observation of one or more practical activities being undertaken.

(b) Steps to ensure that, where evidence generated by a Learner in the practical skills assessment is marked by the Centre, Teachers are applying the criteria outlined above accurately and consistently.

(c) Steps to ensure that Learners have been provided with opportunities to undertake practical activities.

(d) A review of samples of records of Learners' practical activities and Centres' documentation in relation to those activities to ensure that all relevant requirements in relation to the practical activities and practical skills assessments are being met.

(e) Where appropriate, the provision of advice and guidance to the Centre.

Where, during a Monitoring Visit, an awarding organisation identifies an Adverse Effect, or a risk of an Adverse Effect, relating to the delivery or marking of practical skills assessments, it must ensure that any other awarding organisations for whom that Centre delivers practical science assessments for GCE A level qualifications in Biology, Chemistry, Geology or Physics are informed.

An awarding organisation must set out its approach to monitoring, and in particular how it will meet the above requirements, in its assessment strategy.

Certificate Requirements

Certificate Requirements

Condition GCE(Geology)6.3 allows us to specify Certificate Requirements in relation to the way in which a Learner's attainment in a practical skills assessment is reflected on that Learner's certificate for the qualification.

In addition, under Condition I3.1, an awarding organisation is required to ensure that the design of each certificate in relation to a qualification which it makes available complies with the Certificate Requirements which may be published by Ofqual and revised from time to time.

We set out our Certificate Requirements for the purposes of Condition GCE(Geology)6.3 and Condition I3.1 below.

These requirements must be followed together with the Additional Certificate Requirements[9] which apply to all qualifications.

Certificate requirements for practical skills assessments

A certificate will only be issued for a GCE A level qualification in Geology where a Learner has been awarded a grade A* - E in respect of the level of attainment he or she has demonstrated in the Assessments by Examination to be taken for that qualification.

Where a Learner has not been awarded a grade A* - E in respect of those Assessments by Examination, an awarding organisation must ensure that no certificate is issued in respect of that Learner's practical skills assessment, regardless of the result for that assessment.

For clarity, the result for that Learner's practical skills assessment must still be issued, together with the Learner's result in respect of the Assessments by Examination, under Condition H6.1.

Where a certificate will be issued to a Learner in respect of the Assessments by Examination, an awarding organisation must ensure that it meets the following requirements in recording the outcome of the practical skills assessment on that certificate –

(a) Where the Learner has been awarded a Pass, that outcome must be recorded on the certificate.

---

[9] www.gov.uk/government/publications/additional-certificate-requirements

(b) Where the Learner –

(i) has taken the practical skills assessment but has not been awarded a Pass, or

(ii) has not been granted an exemption on grounds of disability from taking the practical skills assessment, but has not taken it,

the outcome reported on the certificate must be Not Classified.

(c) Where the Learner has been granted an exemption from taking the practical skills assessment on grounds of disability, the outcome reported on the certificate must be in line with any requirements which may be published by Ofqual and revised from time to time.

In all cases an awarding organisation must ensure that it is clear that the above outcomes are in relation to the practical skills assessment.

Assessment objectives

Assessment objectives – GCE Qualifications in Geology

Condition GCE(Geology)1.2 allows us to specify requirements relating to the objectives to be met by any assessment for GCE Qualifications in Geology.

The assessment objectives set out below constitute requirements for the purposes of Condition GCE(Geology)1.2. Awarding organisations must comply with these requirements in relation to all GCE Qualifications in Geology they make available.

	Objective	Weighting (A level)	Weighting (AS)
AO1	Demonstrate knowledge and understanding of geological ideas, skills and techniques	*30-35%*	*35-40%*
AO2	Apply knowledge and understanding of geological ideas, skills and techniques	*40-45%*	*40-45%*
AO3	Analyse, interpret and evaluate geological ideas, information and evidence, to make judgements, draw conclusions, and develop and refine practical design and procedures.	*25-30%*	*20-25%*

Geology

GCE AS and A level subject content

March 2016

Contents

The content for AS and A level geology

Introduction

1. AS and A level subject content sets out the knowledge, understanding and skills common to all AS and A level specifications in geology. They provide the framework within which the awarding organisations create the detail of the specification.

Aims and objectives

2. AS and A level specifications in geology must encourage students to:

- develop essential knowledge and understanding of different areas of geology and how they relate to each other, to include civil engineering, engineering geology, hydrogeology, mining geology and petroleum geology
- develop through critical practice the skills, knowledge and understanding of scientific methods as applied in geology through a practical endorsement
- develop competence and confidence in selecting, using and evaluating a range of quantitative and qualitative skills and approaches, (including observing, collecting and analysing geo-located field data, and investigative, mathematical and problem solving skills) and applying them as an integral part of their geological studies (appendix one and appendix two)
- understand how society makes decisions about geological issues and how geology contributes to the success of the economy and society

3. The non-core content of the A level must require students to study two of the option areas of geology detailed in section 10. The purpose of this content, detailed in the non-core knowledge and understanding, is for students to:

- develop and apply their core knowledge and understanding (section 9)
- use their core and non-core knowledge and understanding synoptically
- enrich their understanding of core concepts through an exploration of the chosen non-core areas
- be introduced to the wider context of geoscience in preparation for progression to higher education
- be exposed to current areas of research where new discoveries may revise our understanding of geological phenomena

Subject content

4. AS and A level geology specifications must build on the skills, knowledge and understanding set out in the GCSE content for science and mathematics.

5. Specifications must provide clear progression pathways to higher education by ensuring that there is an appropriate knowledge of the main aspects of geology as a science through three overarching concepts which link all topics studied:

- a scientific understanding of the Earth, its evolution and its sustainable development
- the central paradigms in geology: uniformitarianism (“the present is the key to the past”); the extent of geological time; and plate tectonics
- the cycling of matter and the flows of energy into, between and within the solid Earth, the Earth's surface, the hydrosphere, the atmosphere and the biosphere

6. AS and A level specifications must include a range of contemporary and other geological contexts as exemplified in the core knowledge and understanding (section 9) and in the non-core content (section 10).

7. The skills, and the core knowledge and understanding (section 9) for AS set out below in normal (non-bold) text must comprise 100% of the AS specifications developed from these criteria. The skills, and the core knowledge and understanding (section 9) for A level must comprise approximately 80% of an A level and include all the knowledge and understanding in section 9. The core (section 9) and non-core (section 10) content represents the complete knowledge and understanding required to be studied by A level students including all content in bold text contained within square brackets which is only required for the A level. For A level this would include all the practical requirements in appendices 1a to 1c, while for AS it would include those from appendices 1a and 1d, and 1c as appropriate. For both AS and A level this would include the mathematical requirements in appendix two.

8. The skills, knowledge and understanding for geology must include the requirements set out below including the appendices, and be integrated into the core knowledge and understanding (section 9) required in all specifications and the non-core knowledge and understanding (section 10) added by the awarding organisation. AS and A level specifications must require students to:

- use theories, models and ideas to develop geological explanations
- use knowledge and understanding to pose scientific questions, define geological problems, present scientific arguments and geological ideas
- use appropriate methodology, including information and communication technology (ICT), to answer geological questions and solve geological problems
- carry out fieldwork, experimental and investigative activities in a range of contexts (appendix one), to include the collection, compilation and analysis of Earth science data from the field and subsurface, and appropriate risk management
- manipulate and extrapolate these sometimes incomplete data sets in both two and three-dimensions
- evaluate methodology, evidence and partial data sets, and resolve conflicting evidence

- communicate information and ideas in appropriate ways (including geological maps and cross-sections) using appropriate terminology, SI units and their prefixes (appendix three) and the ability to express in standard form (appendix two)
- know that scientific knowledge and understanding develops over time, consider applications and implications of science in geology, and evaluate their associated benefits and risks
- evaluate the role of geology within the scientific community in validating new knowledge and ensuring integrity

Core knowledge and understanding

9. AS and A level specifications must require students to demonstrate knowledge and understanding of:

Elements, minerals and rocks

- the bulk composition of the Earth and how it is inferred from meteorite evidence (chondrites)
- the geochemical classification of elements by Goldschmidt's system and the processes which partition each geochemical group between the Earth's atmosphere and hydrosphere, crust, mantle and core
- the chemical nature of minerals as naturally occurring elements and inorganic compounds, and how their crystalline structure and composition may be expressed as a chemical formula
- the diagnostic physical properties of minerals in hand specimens - colour, lustre, shape, streak, cleavage/fracture, density and hardness
- how the crystalline structure of silicate minerals are built up from silicon-oxygen tetrahedral to form frameworks, sheets or chains. **[The substitution of elements for others in the crystal structure of a mineral, and olivine and plagioclase feldspar as examples of solid solution series]**
- the diagnostic properties of rocks - colour, composition, grain/crystal size and grain/crystal shape, and sorting/texture and the evidence in rocks -mixtures of one or more minerals- for the igneous, metamorphic or sedimentary processes that formed the rock

Earth structure

- the Earth's internal geological processes resulting from the transfer of energy derived from radioactive decay within the Earth and released as heat of formation by the Earth
- the layered structures of the Earth, and how they are defined by the chemical and the rheological properties of the layers, including the direct and indirect evidence for these models, including geophysical measurements - gravity, seismicity, geomagnetism and conductivity - and mantle xenoliths

Global tectonics

- the framework of plate tectonics including: subduction zones, lithospheric plates (cold thermal boundary) and mantle plumes, the active limbs of convection cells; **[and how mid oceanic ridges are formed]**
- how the detail of plate tectonics can be interpreted from evidence, including:
    - the direct measurement of relative movement of points on different plates using global positioning systems (GPS)
    - the global distribution of geological features including volcanic zones, orogenic belts, palaeoecology and palaeoenvironments
    - earthquake seismology and seismic tomography
    - geomagnetic and geoelectrical data including ocean floor magnetic anomalies
- how plate movement causes tensional, compressive and shear dominated tectonic environments, which can lead to rock deformation as a result of tectonic or gravity induced stresses
- how the plate tectonics paradigm developed over time, including continental drift, active mantle convection carrying passive tectonic plates (mantle drag), slab pull and ridge push

Surface processes: sedimentary environments and sedimentary rocks

- how uniformitarianism and the rock cycle model developed over time, including ideas of catastrophism, mass extinctions, and changing conditions and rates of processes through geological time including the contributions of James Hutton and William Smith
- an understanding of what facies associations are and why facies are the basic unit of sedimentary geology
- how uniformitarianism is applied to enable the interpretation of ancient sedimentary facies by analogy with modern sedimentary sequences and processes, including:
    - the mechanical, chemical and biological processes which form sediments and sedimentary rocks
    - **[how sedimentary processes which are infrequent and/or difficult to observe, for example turbidity currents, can be understood and explained using scientific models**
    - **applying Walther's Law to extend interpretation from two-dimensional data, for example, borehole logs, cliff sections, to three-dimensions]**
- the nature of fossil evidence (the preserved remains of living organisms or traces of those organisms) and the use of fossils as palaeoenvironmental indicators
- the characteristic composition and texture of modern sediments and ancient sedimentary rocks, and how the processes of weathering, erosion and deposition form these characteristic compositions and textures

- the processes of diagenesis and lithification, and how they modify the texture of sedimentary rocks, including the growth of cements, recrystallization of minerals, and how mechanical/chemical compaction change the porosity and permeability of rocks

Internal processes: igneous and metamorphic rocks

- the generation of magma by partial melting in different tectonic contexts including interplate and intraplate settings
- **[the geological processes -assimilation, differentiation and fractionation- which cause magma composition to evolve and be modified]**
- the petrology of intrusive igneous activity including igneous bodies and rocks
- the petrology of volcanic rocks including the surface expressions of igneous activity
- the nature of volcanic hazards and controlling factors including the composition and properties of the magma
- the mineralogy and texture of metamorphic rocks, and how these can be used to reconstruct their history and infer the composition of the parent rock and the conditions at metamorphism -temperature, pressure, **[directed stress and time]**
- the characteristics of rock deformation -brittle and plastic- and how these relate to permanent strain and tectonic stresses
- **[how the composition of the parent rock and conditions at the time of rock deformation -strain rate, temperature and pressure- determine the nature of that rock deformation]**

Evolution of the Earth

- **[how the Earth has changed through geological time (with particular focus on the Phanerozoic Eon) including long-term changes to the global climate, composition of the atmosphere, sea level and distribution of the continents**
- **how evidence for these changes is interpreted from both the geological record (palaeoenvironments) and the geochemistry of the rocks, including isotope studies**
- **the importance of the Anthropocene to illustrate the application of geochronological processes, and the lack of consensus for the epoch[1]]**
- how geological events can be placed in relative and numerical time scales, including:

    - the use of geochronological principles to place geological events in the geological column in relative time sequences
    - the use of radioactive decay rates (**[appendix two - 3.5]**) to give a numerical age based on the presence of radionuclides in minerals

[1] A proposed epoch that began when human activities changed the Earth's surface environment on a scale comparable with the major events of the geological past that are used to mark the geological time scale.

- **[how the evolution of life on Earth, displayed in the fossil record, is used as evidence to investigate long term gradual change and short term catastrophic events]**
- the application of macro **[and micro]** fossils in relative dating **[and correlation]**
- **[the Wilson cycle model and how it can provide an outline framework to understand these long term changes in context]**

Earth materials and resources

- **[how the presence of fluids in rocks and sediments -water, oil and gas is controlled by porosity and permeability, and why the presence and behaviour of these fluids is important to hydrogeology, economic geology, engineering geology and geohazard analysis**
- **how the flow of fluids in rocks can be modeled using Darcy's Law (appendix two - 3.3)**
- **the characteristics of subsurface geology which control the flow of groundwater (hydrogeology) including confined and unconfined aquifers, aquicludes, aquitards, the water table, piezometric surfaces and recharge zones**
- **the controls on groundwater quality which result from geochemistry (carbonates and sulfates), aquifer filtration, residence time and sources of pollution**
- **geological resources and the igneous, hydrothermal or sedimentary processes that form them**
- **the use of both geophysical and geochemical techniques in the exploration for geological resources**
- **the extraction of geological resources and storage of waste products, including the use of planning for extraction/storage to be economic, and for environmental sustainability**
- **the impact of ground conditions on existing and proposed constructions or excavations (engineering geology), including:**

    - **how the strength of rocks and sediments are changed by weathering, fracture density, geological structures and pore water**
    - **how existing data sets and ground investigations are integrated in a geotechnical site assessment**

- **the limitations and utility of geohazards risk analysis, including:**

    - **an understanding of geological processes, and the characteristics of rocks and sediments which contribute to the potential geohazard**
    - **the synthesis and summary of geological data sets and the communication of this information for the use of non-specialists**

- **probability and return period (appendix two 2.3), and the ability to communicate these appropriately to non-specialists]**

Non-core knowledge and understanding

10. [A level specifications must offer a minimum of two of the following seven non-core option areas of geology:

Planetary geology

Specifications offering this option must require students to develop and apply their knowledge and understanding of the core content to include:

- **the formation and accretion of the terrestrial planets, including the Moon, Venus and Mars, giant planets and dwarf planets**
- **the application of remote sensing data for studying the geology of the terrestrial planets**
- **the formation of the Earth Moon system**
- **the differentiation and evolution of the crust, mantle and cores of the terrestrial planets**
- **the role of early life in the Archean and Paleoproterozoic (4.6 to 1.8 Ga) and the Great Oxidation Event**

The lithosphere

Specifications offering this option must require students to develop and apply their knowledge and understanding of the core content to include:

- **the application of geotherms and the mantle solidus curve in identifying the strength of the lithosphere/asthenosphere**
- **the generation of magmas in different settings - mid-ocean ridge basalt MORB, large igneous provinces, island arcs and cordillera**
- **the application of remote sensing data and ophiolites for studying the structure, composition and thickness of the crust and upper mantle**
- **the assembly and development of supercontinents, and the evolution of ocean basins**
- **the processes that lead to the formation and development of orogenic belts and regional structures in orogenic belts**

The stratigraphy of the British Isles

Specifications offering this option must require students to develop and apply their knowledge and understanding of the core content to include:

- **the stratigraphy of the British Isles, including the adjacent continental shelf, in the time period 1000 Ma to 2.6 Ma**

- **the assembly of the lithotectonic terranes that underlie British Isles during three orogenic events**
- **the application of remote sensing and subsurface data to study the Palaeozoic and Neoproterozoic geology of the British Isles**
- **the application of evidence to support the theory that the latitude of the British Isles has changed through the period specified**
- **the global tectonic context over the specified time period and its impact on the geological history of the British Isles**

Quaternary geology

Specifications offering this option must require students to develop and apply their knowledge and understanding of the core content to include:

- **the application of evidence to study frequent changes in global climate that characterise the Quaternary period, including the influence of secular variations in solar radiation**
- **the plate tectonics preconditions which initiate the switch from a global greenhouse to ice house climate in the Phanerozoic ice ages**
- **the application of terrestrial, marine and glaciological evidence to reconstruct Quaternary environmental and climate conditions**
- **the dating techniques that are applicable in the Quaternary, including synchronous markers, radionuclide and incremental methods**
- **hominin evolution in response to repeated large scale environmental and climate change, including hominin evolution up to *Homo sapiens***

Critical resources

Specifications offering this option must require students to develop and apply their knowledge and understanding of the core content to include:

- **the impacts of increased water demand and climate variability (extreme weather events) on a regional groundwater basin**
- **how fossil fuel reserves, including shale gas, shale oil and coal bed methane, are identified, the extractive technologies and the potential for carbon capture and storage (sequestration)**
- **geothermal energy resources in the British Isles and their potential use for ground source heat and cooling**
- **critical elements, for example Rare Earth Element, current mining and potential developments, including the formation of critical element ores, extraction technology and geological challenges to securing sources of critical elements**
- **the quarrying of bulk minerals in the British Isles, including environmental impact of geological factors, extraction planning, and the national and local economic benefits**

Geohazards

Specifications offering this option must require students to develop and apply their knowledge and understanding of the core content to include:

- **the factors which affect the impact of earthquakes, and how geology and civil engineering can reduce the impact of future seismic events**
- **the effectiveness and limitations of probabilistic forecasting and deterministic predictions of geohazards**
- **the causes and effects of geohazards in the British Isles, including shrinking and swelling clays, landslides, subsidence and significant tsunamis in the recent geological past**
- **the application of engineering geology and the impact of major civil engineering activities on the natural environment**
- **the role of geological understanding in the management and remediation of contaminated land and groundwater such as former industrial brownfield sites**

Basin analysis

Specifications offering this option must require students to develop and apply their knowledge and understanding of the core to include:

- **the application of field geology to understanding the palaeoenvironments and geological history of a case study basin**
- **the application of geophysical data to interpret the structural history of the case study basin**
- **the integration of borehole data with geophysical data into the basin model**
- **the application of palaeontology to the interpretation of palaeoenvironments and the use of zone fossils in the basin**
- **the application of basin analysis for economic prospecting in the case study basin]**

Appendix one - working scientifically

Specifications in geology must encourage the development of the skills, knowledge and understanding in science through teaching and study opportunities for regular hands-on practical and fieldwork.

In order to develop all the necessary skills, knowledge and understanding needed for a geology qualification, students will be required to have carried out practical activities especially in field situations, which will contribute towards the direct assessment of practical skills. These skills, knowledge and understanding will also be assessed indirectly in written examinations in the context of these, and other, practical activities.

These practical skills can be split into those which can be assessed indirectly through written examinations (appendices 1a and 1d); and those that will be assessed directly by teachers through appropriate practical activities (appendix 1b). Where the practical skill being directly assessed is identified in appendix 1c as fieldwork apparatus and techniques the assessment must take place on unfamiliar outcrop geology.

The practical activities highlighted as the minimum requirement within specifications must cover the use of apparatus and practical techniques identified for geology (appendix 1c).

Fieldwork

It is impossible for students to develop a satisfactory understanding of geology without significant exposure to field-based teaching and study, and the related assessment. The integration of fieldwork with other teaching methods is core to achieving skills such as the ability to visualize and extrapolate data in three-dimensions or understanding the application of practical methodologies.

AS and A level geology specifications must ensure that students undertake fieldwork which meets the minimum requirements of two days of fieldwork at AS, and four days of fieldwork for A level. Awarding organisations must require evidence of this fieldwork in the form of a written statement from centres. The two days at AS is the minimum fieldwork time for students to develop practical skills (appendix 1d) which will be assessed indirectly in exams. The additional fieldwork days at A level is required for students to develop proficiency in all the relevant requirements of appendices 1b & 1c, and then to demonstrate their competence in practical field geology.

Specifications must require students to:

- undertake fieldwork in different contexts: virtual fieldwork, local fieldwork outside the classroom and fieldwork on unfamiliar outcrop geology
- experience and develop competency in the skills and techniques contained in appendix one

- apply knowledge and concepts to identify and understand field observations
- be given opportunities to develop increasing independence in their application of the investigative and practical skills and techniques in appendix one over the A level course through progression from scaffolded to unscaffolded tasks and from familiar contexts to unfamiliar outcrop geology

Appendix 1a - practical skills identified for indirect assessment and developed through teaching and study

Question papers for AS and A level geology will assess student's abilities to:

Independent thinking

- solve problems set in geological contexts
- apply geological knowledge to practical contexts

Use and application of scientific methods and practices

- comment on investigation design and evaluate scientific methods
- present data in appropriate ways
- evaluate results and draw conclusions with reference to measurement uncertainties and errors
- identify variables including those that must be controlled

Numeracy and the application of mathematical concepts in a practical context

- plot and interpret graphs
- process and analyse data using appropriate mathematical skills as exemplified in the mathematical appendix (appendix two)
- consider margins of error, accuracy and precision of data

Instruments and equipment

- know and understand how to use a wide range of experimental and practical instruments, equipment and techniques appropriate to the knowledge and understanding included in the specification

Appendix 1b - practical skills identified for direct assessment and developed through teaching and study

Practical work carried out throughout the course will enable students to develop the following skills. Students will be directly assessed in relation to these skills based on their completion of at least 12 practical activities during the A level course.

Independent thinking

- apply investigative approaches and methods to practical work

Use and apply scientific methods and practices

- safely and correctly use a range of practical equipment and materials
- follow written instructions
- make and record observations
- keep appropriate records of practical activities, including investigative activities
- present geological information and data in a scientific way
- use appropriate software and tools to process data, carry out research and report findings

Research and referencing

- use online and offline research skills including websites, textbooks and other printed scientific sources of information
- correctly cite sources of information

Instruments and equipment

- use a wide range of investigative and practical instruments, equipment and techniques appropriate to the knowledge and understanding included in the specification

Appendix 1c - use of apparatus and techniques - geology

Specifications for geology must give students opportunities to use relevant apparatus to develop and demonstrate these techniques.

For A level, all of the techniques listed below will be assessed through a minimum of 12 practical activities identified within each specification. These practical activities must allow students to demonstrate all of the practical skills given in appendix 1b. In addition students must be given opportunity to demonstrate competency in fieldwork apparatus and techniques (identified in underlined text and in curly brackets) on

unfamiliar outcrop geology through appropriate practical activities identified within each specification.

Practical techniques to be completed by candidates:

- {location of geological features in the field using traditional navigation and basic field survey skills without the use of GPS
- identification of geological structures in the field recording observations as field sketches
- use of a compass clinometer to measure two and three-dimensional geological data across a range of scales such as the dip and strike of planar surfaces, or the apparent dip of fold limbs exposed on a hillside or cliff section
- construct graphic logs using appropriate scale and symbol sets for unfamiliar geological sequences and exposures
- use sampling techniques in fieldwork}
- apply classification systems using distinguishing characteristics to identify unknown minerals and fossils
- produce annotated scientific drawing of fossils, or small scale features, from hand samples using a light microscope, or hand lens observation
- {produce full rock description of macro and micro features from conserved hand samples and unfamiliar field exposures}
- use of photomicrographs to identify minerals and rock textures
- use appropriate apparatus to record a range of quantitative measurements (to include mass, time, volume, temperature and length)
- use of physical and chemical testing to identify minerals to include:
  - density test
  - Mohs hardness test

- {use methods to increase accuracy of measurements, such as timing over multiple observations, or use of a fiducial (scale in photograph/field sketch)}
- use of ICT to:

  - compile and analyse geological data sets through to visualization using geographic information system (GIS)
  - collect, process and model geological data

Appendix 1d – practical skills identified for indirect assessment and developed through fieldwork

AS students must be given the opportunity to use fieldwork apparatus and techniques on outcrop geology through appropriate practical activities identified within each specification.

Practical techniques to be undertaken by candidates:

- the measurement and description of the diagnostic properties of rocks in the field (colour, composition, grain/crystal size and grain/crystal shape, and sorting/texture)
- the collection of valid data in the field relating to the igneous, metamorphic or sedimentary processes that formed the rocks, including valid sampling
- the measurement and description of rock deformation in the field including valid sampling
- the use of geochronological principles in the field to place geological events in relative time sequences

Appendix two - mathematical requirements and exemplifications

In order to be able to develop their skills, knowledge and understanding in geology, students need to have been taught, and to have acquired competence in, the appropriate areas of mathematics in the context of the relevant geology as indicated in the table of coverage below.

All mathematical content will be assessed within the lifetime of the specification.

The following tables illustrate where these mathematical skills may be developed. Those shown in bold type and in square brackets will only be tested in the A level specification.

This list of examples is not exhaustive. These skills could be developed in other areas of specification content.

Ref	Mathematical skills	Exemplification of mathematical skill in the context of A level geology (exemplification is not limited to that given below)
1 - Number		
1.1	Recognise and make use of appropriate units in calculations	Candidates should demonstrate their ability to: • convert between units e.g. ppb to gram per tonne • as part of calculations for gold ore concentration factor • work out the unit for a rate e.g. sedimentation rate
1.2	Recognise and use expressions in decimal and standard form	Candidates should demonstrate their ability to: • use an appropriate number of decimal places in calculations e.g. for a mean • carry out calculations using numbers in standard and ordinary form e.g. use of magnification • convert between numbers in standard and ordinary form • understand that significant figures need retaining when making conversions between standard and ordinary form e.g. 0.063 mm is equivalent to 6.3 x 10^{-2} mm

1.3	Use an appropriate number of significant figures	Candidates should demonstrate their ability to: • report calculations to an appropriate number of significant figures given raw data quoted to varying numbers of significant figures • understand that calculated results can only be reported to the limits of the least accurate measurement
1.4	Use ratios, fractions and percentages	Candidates should demonstrate their ability to: • calculate percentage yields • calculate surface area to volume ratio • use scales for measuring
1.5	Make order of magnitude calculations	Candidates should demonstrate their ability to: • use and manipulate the magnification formula magnification = $\frac{\text{size of image}}{\text{size of real object}}$
1.6	Estimate results	Candidates should demonstrate their ability to: • estimate results to sense check that the calculated values are appropriate
2- Statistics and probability		
2.1	Find arithmetic means	Candidates should demonstrate their ability to: • find the mean of a range of data e.g. the mean clast size
2.2	Construct and interpret frequency tables and diagrams, bar charts and histograms	Candidates should demonstrate their ability to: • represent a range of data in a table with clear headings, units and consistent decimal places • interpret data from a variety of tables e.g. data relating intrusive dykes • plot a range of data in an appropriate format e.g. grain size distribution as a cumulative frequency graph • interpret data for a variety of graphs e.g. explain seismograph traces

2.3	**[Understand simple probability]**	**[Candidates should demonstrate their ability to:** • **use the terms probability and chance appropriately** • **understand the probability associated with return periods for geohazards]**
2.4	**[Identify uncertainties in measurements and use simple techniques to determine uncertainty when data are combined]**	**[Candidates should demonstrate their ability to:** • **calculate percentage error where there are uncertainties in measurement]**
2.5	Understand the principles of sampling as applied to scientific data	Candidates should demonstrate their ability to: • estimate optimum sample size from a plot of number of clasts sampled v running mean of mean b-axis length
2.6	Understand the terms mean, median and mode	Candidates should demonstrate their ability to: • calculate or compare the mean, median and mode of a set of linear data e.g. Folk and Ward graphic statistics from sieve analysis of sand samples from different sedimentary environments. • **[calculate (graphically) or compare vector mean, median and mode of a set of circular data e.g. palaeocurrent directions in an aeolian sandstone]**
2.7	**[Know the characteristics of normal and skewed distributions]**	**[Candidates should demonstrate their ability to:** • **being presented with a set of data for crystal size in an igneous intrusion and being asked to indicate the position of the mean (or median, or mode)** • **interpret size analysis data from sieving of different sands]**
2.8	Understand measures of dispersion, including standard deviation and interquartile range	Candidates should demonstrate their ability to: • calculate the standard deviation • understand why interquartile range might be a more useful measure of dispersion for a given set of data than standard deviation e.g. where there is an extreme observation which is part of the

		inherent variation
2.9	Plot two variables from experimental or other linear data	Candidates should demonstrate their ability to: • select an appropriate format for presenting data: bar charts, histograms, graphs, triangular diagrams and scattergrams
2. 10	Use a scatter diagram to identify a correlation between two variables	Candidates should demonstrate their ability to: • interpret a scattergram e.g. rate of plate motion v total length of subducting plate margin
2. 11	**[Plot variables from experimental or other circular data]**	**[Candidates should demonstrate their ability to:** • **select an appropriate format for presenting data, raw data plot, circular bar graph, rose diagram and polar equal area stereonet (polar plots only not projections or great circles)]**
2.12	**[Select and use a statistical test]**	**[Candidates should demonstrate their ability to select and use:** • **the chi squared test to test the significance of the difference between observed and expected results e.g. palaeocurrent data** • **the Mann-Witney U test e.g. clast sizes in two conglomerate beds** • **Spearman's rank correlation coefficient e.g. bed thickness and maximum clast size]**
3 – Algebra and graphs		
3.1	Understand and use the symbols: =, <, <<, >>, >, α and ~	No exemplification required
3.2	Change the subject of an equation	Candidates should demonstrate their ability to: • use and manipulate equations e.g. magnification
3.3	**[Substitute numerical values into algebraic equations using appropriate units for physical quantities]**	**[Candidates should demonstrate their ability to:** • **use a given equation e.g. Darcy's law $Q = -\kappa A\left(\frac{h_2-h_1}{L}\right)$]**

3.4	**[Solve algebraic equations]**	**[Candidates should demonstrate their ability to:** • **solve equations in a geological context e.g.** $\boldsymbol{\varphi = -log_2\left(\frac{D}{D_0}\right)}$**]**
3.5	**[Use calculators to find and use power, exponential and logarithmic functions]**	**[Candidates should demonstrate their ability to:** • **solve for unknowns in radionuclide decay problems e.g.** $\boldsymbol{N = N_0 e^{-\lambda t}}$**]**
3.6	**[Use logarithms in relation to quantities that range over several orders of magnitude]**	**[Candidates should demonstrate their ability to:** • **use a logarithmic scale in the context of geology e.g. decay law of radioactivity / Udden-Wentworth grain size scale]**
3.7	Translate information between graphical, numerical and algebraic forms	Candidates should demonstrate their ability to: • understand that data may be presented in a number of formats and be able to use these data e.g. time distance curves for earthquakes
3.8	Understand that $y = mx + c$ represents a linear relationship	Candidates should demonstrate their ability to: • predict/sketch the shape of a graph with a linear relationship e.g. burial curves in a sedimentary basin or the effect of intrusion size on the width of the baked margin
3.9	**[Determine the slope and intercept of a linear graph]**	**[Candidates should demonstrate their ability to:** • **read off an intercept point from a graph e.g. the initial velocity of a velocity time graph for a density current]**
3.10	Calculate rate of change from a graph showing a linear relationship	Candidates should demonstrate their ability to: • calculate a rate from a graph e.g. geothermal gradient through lithosphere
3.11	**[Interpret logarithmic plots]**	**[Candidates should demonstrate their ability to:** • **use logarithmic plots with decay law of radioactivity]**
4 - Geometry and measures		

4.1	**[Calculate the circumferences, surface areas and volumes of regular shapes]**	**[Candidates should demonstrate their ability to:** • **calculate the circumference and area of a circle** • **calculate the surface area and volume of rectangular prisms, of cylindrical prisms and of spheres e.g. calculate the surface area or volume of a longwall panel]**
4.2	Visualize and represent 2D and 3D forms, including 2D representations of 3D objects	Candidates should demonstrate their ability to: • draw geological cross-sections interpreted from geological maps • interpret block diagrams to show geological structures in 3D • interpret field exposures and recording 3D geological structures using field sketch
4.3	**[Use sin, cos and tan in physical problems]**	**[Candidates should demonstrate their ability to:** • **determine true thickness of rock units** • **interpret block diagrams to show geological structures in 3D** • **crustal extension or shortening]**

Appendix three – SI units in geology

The International System of Units (Système International d'Unités), which is abbreviated as SI, is a coherent system of base units. The six which are relevant for AS and A level geology are listed below. We also list eight of the derived units (which have special names) selected from the SI list of derived units in the same source.

Base units

These units and their associated quantities are dimensionally independent:

metre (m), kilogram (kg), second (s), ampere (A), kelvin (K) and mole (mol).

Some derived units with special names

Frequency hertz (Hz), force newton (N), energy joule (J), power watt (W), pressure pascal (Pa), electric charge coulomb (C), electric potential difference volt (V) and electric resistance ohm (Ω).

Some non-standard units used in geology

Time day (d), time year - annum (a) and mass tonne (t).
