Summary

- In 2016/17 there were 2.3 million students at UK higher education institutions.
- Most full-time students are studying first degrees. There are proportionately more overseas students studying postgraduate courses.
- Over the past decade the number of entrants to ‘other undergraduate’ courses has fallen by over 60%. The large majority on these courses are part-time UK students.
- Total part-time entrants have fallen by overall 47% since 2009/10; 67% in ‘other undergraduate’ courses, 38% first degrees, 14% taught postgraduate and 12% postgraduate research courses.
- There were almost 700,000 applications for full-time undergraduate places through UCAS in 2017 and 534,000 were accepted.
- Applicant numbers fell in 2012 with larger falls among those who faced fees of up to £9,000. The total was 7.6% down.
- Applicant numbers bounced back in 2013. A record number were accepted in 2013 and new records were set for acceptances in each of the three following years.
- Applicants for 2018 were down by 1% (by mid-January) with larger falls from the UK and older age groups and those from England wanting to study nursing.
Headline student numbers have increased to new record levels in recent years following a short dip related to the 2012 reforms in the sector. There have been continued increases in entry rates for different groups of students, including those from disadvantaged areas/backgrounds where rates have also hit new record levels. However, headline numbers tend to focus on full-time undergraduates and there are ongoing concerns about student numbers outside this group where trends have not been so positive. This includes part-time undergraduates, particularly those not studying first degrees, some postgraduate students, overseas students from some countries, especially India, mature students and some disadvantaged groups. There is also uncertainty about the impact of Brexit on EU student numbers.

This paper looks at trends in the size of the student population, changes in the number of entrants overall and for different types of students/courses and entry rates for different groups and areas.

This paper replaces Entrants to higher education and HE in England from 2012: Student numbers which looked in detail at policy around student number control and focussed on annual changes in student numbers, especially in the period leading up to and just after the 2012 higher education funding reforms. Those papers will no longer be updated. The data in this paper will be regularly updated and its coverage expanded over time.

The paper Education: Historical Statistics includes much longer term trends in student numbers. Readers may also be interested in the following briefing papers:

1. Snapshot

In academic year 2016/17 there were just over 2.3 million students at UK higher education institutions. This covers all years, modes, levels and domiciles. A full-breakdown is given below and a summary by broad category is shown opposite.

Key points are:

- Most full-time students are studying first degrees.
- Home students on full-time first degrees made up just over half of the total student population.
- There are proportionately more overseas students studying postgraduate courses.
- Overseas students are much more likely to be full-time.
- EU students are more likely than other overseas students to be studying at undergraduate level.
- The large majority of ‘other undergraduate’ courses are taken part-time by home students.

2. Full-time undergraduates applying through UCAS

2.1 All applicants and entrants through UCAS

There were almost 700,000 applicants for full-time undergraduate places through UCAS in 2017 and 534,000 were accepted. The table opposite summarises trends since UCAS was created following the reform of the sector in the early 1990s. The same data is illustrated in the chart below. These are annual numbers of applicants and entrants so show changes in the flow of students, not the overall population.

There have been underlying increases in applicants and acceptances (averaging 2.0% and 3.0% a year respectively) since the mid-1990s. The total number of home applicants via UCAS rose in each year between 1999 and 2005. There was a 4.1% drop in 2006, the first year of ‘variable’ fees. The drop in 2006 was greater than that seen in 1998—the previous change to tuition fees. Both were preceded by relatively large increases in applications.

There was a return to the upward trend in 2007; applicant and acceptance numbers reached new records which were exceeded in 2008, 2009 and 2011.

Applicant numbers fell in 2012 with larger falls among those who faced fees of up to £9,000. The total was 7.6% down; accepted applicants were down by 5.5%. Applicant numbers bounced back somewhat in 2013. A record 496,000 were accepted in 2013 and new records were set for acceptances in each of the three following years. Applicant numbers rose again in 2014, but did not beat their 2011 peak until 2015. There was a small fall in acceptances and a larger drop in applicants in 2017.

Much more detail on annual changes in these numbers for the period 2008 to 2014 and analysis of the impact of the 2012 funding changes is included in the papers Entrants to higher education and HE in England from 2012: Student numbers.
The coverage of UCAS figures has increased over time as more courses have come under their remit. In general the impact is quite small, but some changes in coverages, such as the inclusion of ex-Nursing Midwifery Admission Service courses in 2008 had a much greater effect. These data are not adjusted in any way for these changes.

UCAS figures are published more frequently than others in this paper and are more up-to-date. Their figures can be found on the data and analysis pages of their website along with a timetable of when new figures are published.

2.2 Breakdown by student characteristics

The reference table at the end of this paper gives a breakdown of applicants and acceptances by broad group. These are also illustrated in summary form below and opposite.

Sources: UCAS annual datasets; End of cycle report 2017, UCAS

Key points to note are:

- The number of (all) overseas applicants has increased at a faster rate than those from the UK across the whole period.
- The drop in overseas applicants in 2012 was much smaller and more short-lived than among potential UK students.
- There were more women accepted through UCAS than men for the first time in 1996. Since then the gap has grown to around 70,000 home students or 30% more women than men.
- Overall the number of acceptances among young (<21) students has grown at a faster rate than for older applicants.
- The numbers of young people accepted resumed its earlier upward trend after 2012, while there has been little increase among those aged 21+.
- The largest percentage increases in 2015 and 2016 acceptances were among EU students at 11% and 7% respectively. This could, in part, be connected to lifting the cap on student numbers.
2.3 Applications for the 2018 cycle

The total number of applicants for the 2018 cycle by 15 January\(^1\) was 559,000, down by around 11,400 or 0.9% on the same point in the 2017 cycle. The 2018 figure was the lowest January number since 2013. There were larger than average falls in home applicants (2.6%) which is connected in part to the drop in the number of 18 year olds in the population.

The number of 18 year olds home applicants fell by (1.6%), but this was a smaller drop than that seen among older age groups. Application rates among 18 year olds from England actually increased in 2018 to a new record January level of 37.4%.

Applicants to nursing by mid-January fell by around 4,500 or 13%. The 2017 figures themselves were down by 20% on the previous year. This was driven by 4,400 fewer applicants from England, where from 2017 new student nurses will no longer be eligible for bursaries to help with the costs of studying. This was a fall of 13%. Nursing students tend to be somewhat older than the general full-time undergraduate intake. The decline in applications to nursing from older groups was even larger.\(^2\)

2.4 Application and entry rates

While total student/entrants numbers tell us about the overall size of the student population they tell us less about the level of demand from different groups of potential students or how successful they are at getting into university. Rates based on the size of these different groups help us to do this and are particularly important when comparing groups of different sizes or changes over time in a group that has increased or decreased in size.

Box 1: UCAS definitions of disadvantaged students

UCAS uses a number of different classifications of disadvantage among 18 year olds for its entry rates. These include where people live (POLAR3 classification of levels of young HE participation) and proxy measures for family income - whether the student was eligible for free school meals (FSM) or their family received a means-tested benefit while they were at school. According to UCAS:

This is important because there is a wide variation in entry rates across combinations of these groups… Entry rates are used in these calculations because they directly measure the level of representation of different groups in HE, allowing the identification of those who are ‘disadvantaged’ in terms of their entry rate to university.

Recently UCAS has started combining different measures of disadvantage/equality for students from England into a single measure:

…a range of equality dimensions (sex, ethnic group, POLAR3, secondary education sector type, and FSM status) are combined to create an equality measure, which can then be estimated for pupils who were aged 18 in later years.

The methods used seek to predict whether an individual enters higher education or not when aged 18, using only the equality characteristics and their interactions with each other. The resulting predicted entry

\(^1\) 15 January is the ‘on time’ deadline and normally covers around 85% of UK applicants across the whole cycle. Potential students can still apply up to the end of June, later applications go into clearing.

\(^2\) 2018 cycle applicant figures – January deadline, UCAS
UCAS has estimated entry rates for many different groups of students and their figures go back to 2006. Some trends are illustrated below and a snapshot of a wider range of groups is shown opposite.

Many entry rates have reached new record levels after 2012 and set new ones each year after. These include the national 18 year old rate, the cohort entry rate (18 and 19 year olds), those for both men and women, students formerly eligible for FSM and other disadvantaged groups.

The size of the gap between FSM and non-FSM students has fallen in relative but not absolute terms over the past decade. The relative gap itself increased slightly in 2016 and 2017. The entry rate gap between

---

3 Data for FSM, MEM groups and POLAR groups are all for England only
students from the areas with the highest and lowest levels of historical participation (POLAR groups 5 and 1) has fallen in both relative and absolute terms over time. This was also the case for the most advantaged and disadvantaged MEM groups. However, the gaps between the most and least disadvantaged groups still remained substantial in 2017 and the overall MEM gaps increased in absolute and relative terms in 2016 and 2017.

UCAS breaks down some of its group entry rates by the ‘tariff’ level of different universities. There are three tariff groups; high, medium and low and these refer to average grades of students admitted. High tariff institutions where entrants have higher grades are generally considered more prestigious and harder to get into. This type of analysis therefore can shed light on a different aspect of widening participation. In 2016 only 2.5% of 18 year olds from England who were eligible for FSM at school got into one of these high tariff universities. The rate has increased over time from less than 1.5% in the period 2006 to 2010, but was still well below the 9.5% for the non-FSM group. The size of the relative gap has fallen over time; in 2006 the non-FSM group were almost six time as likely to go to a high tariff university and this fell to below four times as likely in 2016. However, the absolute gap has increased in recent years from six percentage points in 2012 to seven points in 2016.

UCAS has also produced interactive data ‘explorers’ for its data on constituencies and disadvantaged groups:

Entry rate data explorer for parliamentary constituencies
Equality and entry rates data explorer

2.5 Non-UCAS data on entry rates

The Department for Education (DfE) publishes annual participation rates for England. The Higher Education Initial Participation Rate4 (HEIPR) was first produced to measure progress against the last Labour Government’s 50% higher education aspiration. Trends in the HEIPR are illustrated opposite. A new methodology was introduced in 2006/07. The overall level peaked initially at 49.0% (of those aged under 30) in 2011/12. It fell to 43% in 2012 and has risen subsequently to a new (provisional) high of 49.3% in 2015/16.

---

4 This measure covers 17-30 year old English domiciled first-time participants in HE at UK HE Institutions, and at English, Welsh and Scottish Further Education Colleges. The HEIPR is a sum of the participation rates for each age from 17 to 30 inclusive. or each age from 17 to 30, the initial participation rate is calculated as the fraction of the academic year population that are initial entrants. These rates are added to create the total HEIPR.
Further breakdowns of the HEIPR by age and mode can be found in the DfE publication Participation rates in higher education: 2006 to 2016.

The DfE also publishes higher education entry rates by free school meal (FSM) eligibility. This covers young people who were in the state sector in England only. In 2014/15 24% of those eligible for FSM aged 15 (in 2010/11) had entered HE at ages 18 or 19. This was up from 13% and surpassed the 2012/13 peak of 23%. The rate among the non-FSM group was 41% in 2014/15. The absolute gap between these rates has decreased over time from 19 percentage points in 2005/05 to 17 points in the latest two years.

The rate among the FSM group varied considerably across local authorities from 10% or below in Barnsley, East Sussex and Shropshire to more than 50% in Westminster, Kensington and Chelsea and 50% Redbridge in Hackney. In general FSM entry rates were much higher in London and above average in some other large urban areas. The FSM/non-FSM gap was as high as 35 percentage points in the Wirral and below 10 points in much of inner London.

Full details of these rates and other indicators for disadvantaged groups can be found in the DfE publication Widening participation in higher education: 2017.

3. All modes all levels

3.1 Higher Education Statistics
Agency data for the UK

All students
In 2016/17 there were 2.32 million students at UK higher education institutions. This was slightly higher than in the previous three years but below levels in 2008 to 2013. The recent high was 2.50 million in 2010/11. Trends over the past decade are summarised in the table below and illustrated opposite.

Changes in the stock of students reflect any underlying shifts in the duration of courses taken and hence the full-time/part-time split rather than just a measure of demand for, and supply of, places. The number of first year students (entrants) is not affected by this. There were 1.01 million first years in 2016/17, slightly above the 2015/16 total, but again below the peak which was 1.19 million in 2009/10. Trends are also illustrated opposite.
Types of courses and students
The decline in entrants has been solely due to the fall in ‘other undergraduates’. Their numbers fell by more than 210,000 (64%) over the decade while there were increases in those on first degree courses of around 100,000 (24%), postgraduate research of around 5,500 (19%) and postgraduate taught programmes of just almost 60,000 (24%).

Other undergraduate courses are generally taken part-time and students on these courses make up a large proportion of total part-time numbers. This means that total part-time entrants have fallen steeply as well from 470,000 in 2009/10 to below 250,000 in 2016/17; a drop of 47% compared to an increase of 7% in full-time numbers. There were falls in each type of part-time course over this period; 67% in part-time other undergraduates, 38% in first degrees, 14% taught postgraduate and 12% postgraduate research courses. Most of the decline in part-time postgraduate courses was to 2012/13 and numbers have stabilised or increased slightly since then.

Source: Students in higher education institutions, various years, HESA
Overseas students

Home students make up the large majority of part-timers and as such their numbers have fallen since the end of the last decade (see opposite). Overseas student numbers increased to 2011/12, dipped in 2012/13 and have fallen slightly since.

The table below/opposite gives the latest data on where these students come from. China clearly dominates with almost as many students in the UK as the rest of the top ten combined. Some of the key recent trends were:

- Chinese first year student numbers are up by 24% since 2011/12, while numbers from the US have been broadly stable over the same period
- Indian student numbers have fallen by 40% since 2011/12 and there has been a more recent decline in numbers from Nigeria and Malaysia.
- Overall first year EU student numbers are down by 3% since 2011/12, but all this cut happened in 2012/13 and numbers have increased in each subsequent year, with a particularly large increase in 2016/17.
- There has been a general decline in students from the major EU origins since 2011/12; Ireland down by 36%, Greece 16%, Germany 12% and France 6%. Italy was the exception with numbers up by half.

In 2015/16 56% of Chinese students were studying at postgraduate level (mainly taught courses), a very similar rate to those from the US (57%) and slightly below the proportion of Indian postgraduates (64%). The majority of EU students were undergraduates (63%).

Higher Education Statistics Agency (HESA) data covers higher education institutions across the whole of the UK. It includes data on students at all levels, modes and years. It also includes figures on further education courses at higher education institutions, but these are not covered here. Some of their data is freely available online and can be found at:
https://www.hesa.ac.uk/data-and-analysis/students

3.2 Higher Education Funding Council for England analysis

The Higher Education Funding Council for England (HEFCE) publishes regular statistics and analysis of student numbers at English institutions. Their main focus is on home and EU students – those their funding/remit is linked with to some extent. This analysis is therefore especially relevant on the impact of changes in policy, specifically the impact of the 2012 reforms in England.

As the large majority of UK students study in England English the HEFCE data tends to show very similar trends to the HESA data set out above. This paper therefore just summarises some of their recent analysis and commentary around these trends. It is taken from the following:

---

Source: Statistical first release SRB424, HESA
Higher education student numbers

- Pressure from all sides: Economic and policy influences on part-time higher education (April 2014)
- Higher education in England: The population of undergraduates (March 2017)
- Higher education in England: The population of postgraduates (March 2017)

The briefing paper HE in England from 2012: Student numbers looked in much more detail at their data and analysis from this period.

**Undergraduates**

The fall in full-time undergraduate entrants between 2010/11 and 2012/13 was concentrated in courses other than first degrees. Entrants to these courses fell by 35%. Just over half of the fall was due to changes in nursing qualifications, which shifted from diplomas to degrees. Among other courses taught at higher education institutions the largest absolute fall was almost 8,000 in foundation degrees.6

These trends have continued and in 2014 they said that “Higher education institutions appear to be existing the market for study below degree level and focussing their undergraduate provision around degree courses.” There has been an increase to these courses at further education colleges.

The 2012 reforms cut the funding for part-time as well as full-time undergraduate courses, but part-time students had access to tuition fee loans for the first time in 2012. The largest fall in entrants in 2012 across all broad modes and levels was in part-time undergraduates. Their number fell by 78,000 or 34% in 2012/13. There were further falls of 20,000 in 2013/14, 18,000 in 2014/15, 5,000 in 2015/16 and 10,000 in 2016/17. These took numbers to 63% below their 2008 level.

HEFCE suggestions of the different contributory factors behind the scale of the drop in part-time undergraduates included:

- Cuts in funding for equivalent and lower qualifications from 2008/09
- Phasing out of the programme to promote employer co-sponsored courses after 2011/12
- The 2012 funding reforms, specifically the loss of most direct funding for teaching, the impact on fees, possible confusion around the operation of loans, reluctance among mature students to take out loans and the fact that loans are not available for courses with an intensity of less than 25%
- The impact of the recession and continued ‘challenging’ economic conditions on individuals to fund their own part-time courses and employers to directly fund courses for their employees.

HEFCE said in 2014 that the overall decline in part-time entrants may “…have a detrimental impact on widening access overall”. This is because part-time higher education tends to have a higher share of students with characteristics linked to lower levels of participation - more mature students and those from ‘non-traditional backgrounds’ including disadvantaged, students with low prior qualifications or caring responsibilities.

HEFCE has linked the sharp decline in part-time students to the impact of the recession on Government spending, company training budgets, the 2012 funding reforms and some earlier policy changes.

6 The funding council removed additional support for these courses from 2010/11.
**Postgraduates**

Full-time postgraduate entrants increased from 2007 to 2011. They remained broadly stable up to 2015/16 before increasing by 22% (taught courses) in 2016/17. This jump is thought to be due to the introduction of loans for these courses. There was a smaller increase in part-time taught postgraduate courses of 9%. Full-time postgraduates are now in the majority (55% among home and EU students) after being the minority of entrants before 2011.

Much of the decline in part-time taught postgraduate entrants was in the subject area of education. Without this subject the decline in part-time postgraduate courses has been much more modest. While postgraduate fees have increased HEFCE said that the main policy impact on part-time postgraduate entrants have been changes leading to lower support from employers for such courses in education. They also link the wider reduction in part-time postgraduate study to austerity measures introduced by the (then) current Government which have reduced public sector employment and cuts in training and development budgets.

HEFCE have raised the possibility that 2012 undergraduate entrants could be less likely to go on to postgraduate study because of their higher debts and limited access to finance. It is suggested that these effects will vary between different socio-economic groups and could result in a wider gap in postgraduate entry rates between these different groups. In their 2014 assessment they said “There is evidence to suggest that it is increasingly the better off who engage in study for a taught masters or doctorate.”

---

7 Almost 19,000 out of a total fall of 25,000. The share was even larger (84%) if only higher education institutions are included.
8 And hence in potential part-time study particularly in education and subjects allied to medicine.
9 [Higher education in England 2014 Analysis of latest shifts and trends](https://www.hefce.ac.uk/pubs/rpt/r0314/), HEFCE p.37
### SUMMARY OF APPLICANTS AND ACCEPTED APPLICANTS TO HIGHER EDUCATION VIA UCAS

About the Library

The House of Commons Library research service provides MPs and their staff with the impartial briefing and evidence base they need to do their work in scrutinising Government, proposing legislation, and supporting constituents.

As well as providing MPs with a confidential service we publish open briefing papers, which are available on the Parliament website.

Every effort is made to ensure that the information contained in these publicly available research briefings is correct at the time of publication. Readers should be aware however that briefings are not necessarily updated or otherwise amended to reflect subsequent changes.

If you have any comments on our briefings please email papers@parliament.uk. Authors are available to discuss the content of this briefing only with Members and their staff.

If you have any general questions about the work of the House of Commons you can email hcenquiries@parliament.uk.

Disclaimer

This information is provided to Members of Parliament in support of their parliamentary duties. It is a general briefing only and should not be relied on as a substitute for specific advice. The House of Commons or the author(s) shall not be liable for any errors or omissions, or for any loss or damage of any kind arising from its use, and may remove, vary or amend any information at any time without prior notice.

The House of Commons accepts no responsibility for any references or links to, or the content of, information maintained by third parties. This information is provided subject to the conditions of the Open Parliament Licence.
