Summary

This note sets out information on the levels and rates of poverty in the UK, including historical trends and forecasts for future years. The focus here is on poverty defined in terms of disposable household income, although poverty may be defined in different ways and there is no single, universally accepted definition.

Measuring poverty

Various poverty measures based on disposable household income are in common use and the trend can look quite different depending on the measure used. Two commonly used measures are:

- people in relative low income – living in households with income below 60% of the median in that year;
- people in absolute low income – living in households with income below 60% of (inflation-adjusted) median income in some base year, usually 2010/11.

So the ‘relative low income’ measure compares the households with the lowest incomes against the rest of the population in that year, while the ‘absolute low income’ measure looks at whether living standards at the bottom of the distribution are improving over time. A low income measure can also be combined with an assessment of whether households have access to key goods and services, for a measure of low income and material deprivation.

Income can be measured before or after housing costs are deducted. Poverty levels are generally higher based on income measured after housing costs, because poorer households tend to spend a higher proportion of their income on housing.

The extent of poverty

Around one in six people in the UK are in relative low income before housing costs (BHC), rising to more than one in five once we account for housing costs (AHC).

Overall, levels of relative low income have been fairly steady over the past few years, but this varies between population groups: the proportion of children and pensioners (to a

lesser extent) in relative low income is higher than it was five years ago. The share of people in absolute low income, on the other hand, has seen a modest decrease over the last five years (continuing a long-term trend of falling levels of absolute low income), at least on the AHC measure. This indicates that there has been some improvement in living standards for the poorest households but the gap between them and middle-income households has remained about the same.

Absolute low income in the UK in 2017/17

9.5 million people (15%) are in absolute low income BHC and 12.5 million AHC (19%).
This includes 2.5 million children (18%) in absolute low income BHC and 3.7 million AHC (26%).

Over the longer-term, there has been a reduction in poverty rates since the late 1990s for children, pensioners and working-age parents. However, for working-age adults without dependent children the likelihood of being in relative low income has increased.

Forecasts for poverty

Projections produced by the Institute for Fiscal Studies (IFS) and Resolution Foundation suggest that the share of children in relative low income will increase sharply between 2015/16 and 2021/22, assuming no change in government policy. These projections were prepared before the publication of the latest poverty estimates.

The Resolution Foundation’s projections suggest child poverty will rise within the next five years, and will be 6 percentage points higher in 2023/24 than in 2016/17: equivalent to an extra 1 million children in poverty. The Resolution Foundation have also modelled the effect of various benefit changes on child poverty – finding that child poverty is likely to rise without “serious new spending or the cancellation of planned cuts”. Changes for other groups are forecast to be less dramatic.

Other ways of thinking about poverty

Although this note discusses income-based measures of poverty, these have been criticised by government ministers since 2010 as failing to acknowledge the root causes of poverty and resulting in skewed policy responses that try to lift those just below the poverty threshold to just above it. The Welfare Reform and Work Act 2016 removed four child poverty targets previously set out in the Child Poverty Act 2010, and instead

5 Poverty in the UK: statistics

introduced statutory 'life chances' indicators relating to children in England living in workless households and educational attainment at the end of Key Stage 4 (age 16).

A policy paper published by the Department for Work and Pensions in April 2017, *Improving Lives: Helping Workless Families*, set out seven other non-statutory indicator areas, relating to parental conflict; poor parental mental health; drug and alcohol dependency; problem debt; homelessness; early years; and youth employment.

The *Social Metrics Commission* (SMC) has also proposed a new measure of poverty, which accounts for differences among household such as costs of childcare and disability, savings and access to assets. The trends in the SMC measure are similar to relative poverty measured after housing costs (AHC), although pensioner poverty is lower on the SMC measure than in the official statistics.

1. Definitions, measurement and sources

Defining poverty: Relative and absolute low income

There are various ways of defining poverty and no single definition is universally accepted. In the UK, the headline measures are based on household income and so these are the focus of this paper. In particular, two commonly used measures are:

- An individual is in **relative low income** (or relative poverty) if they are living in a household with income below 60% of median household income in that year. This measure essentially looks at inequality between low- and middle-income households.
- An individual is in **absolute low income** (or absolute poverty) if they are living in households with income below 60% of the 2010/11 median, uprated for inflation. By using an income threshold that is fixed in time, this measure looks at how living standards of low-income households are changing over time.

Income can be measured before or after housing costs have been deducted (BHC or AHC). Poverty levels are generally higher when household incomes are measured AHC, as households at the lower end of the income distribution tend to spend a larger share of their income on housing than higher-income households.

Official poverty estimates for the UK are published by the Department for Work and Pensions (DWP) in its annual *Households below average income* (HBAI) publication.

1.1 Relative and absolute low income

The headline poverty measures used in the UK count the number of individuals falling below a threshold of household disposable income. This threshold can vary from year to year in line with average incomes or may be held constant in real terms (i.e. after adjusting for inflation).

One commonly used measure is people in **relative low income** (sometimes referred to as relative poverty). This counts people living in households with income below 60% of median household income.

Another measure is **absolute low income** (or absolute poverty), which counts people living in households with income below 60% of the median in some base year (usually 2010/11), uprated for inflation.

The median is the point at which half of households have a lower income, and half have a higher income. In simple terms, the relative low income measure looks at inequality between low- and middle-income households. The absolute low income measure on the other hand indicates the extent to which living standards of low-income households are improving over time, although it does not take into account changes in what is commonly perceived as an acceptable standard of living.

However, income will not always reflect the extent to which a family can afford necessities. Therefore a low income threshold may be combined with some assessment of whether households are able to access key goods and services for a measure of **low income and material deprivation** (see [section 11](#) of this briefing paper).

What do we mean by income?

Individuals and households can obtain income from a range of sources. These include earnings from employment, cash benefits (for example the State Pension, housing benefit, tax credits, etc), investments, private pensions and other forms of income. Some of this income may be taxed.

In the context of poverty statistics, we generally look at household income measured after adding on benefits and after deducting direct taxes (that is, disposable income) as a guide to the resources available to the household.

Household income is likely to be more informative than individual income in this context, since we may expect income to be shared between household members. Certain forms of income are also determined by household composition – for example, tax credit awards or child benefit payments.

However, a larger household is likely to need a higher level of income in order to enjoy the same standard of living as a smaller household. Therefore, to better enable comparisons of living standards, the statistics on household income are 'equivalised' to adjust for differences in household size and composition.

Equivalisation means that the income threshold below which someone is considered to be in poverty differs by household type. Suppose a family with children has the same (unequivalised) disposable income as a single person: it is possible for the family to be counted as being in poverty even if the single person is not, because they have to make their income stretch across all household members.

The standard of living afforded by a given level of income will of course depend on the price of goods and services, so when making comparisons between years we adjust incomes for inflation (to obtain 'real' incomes).

1.2 Housing costs

Household income may be measured before or after housing costs are deducted (BHC or AHC). Both measures are commonly used, although in some cases one measure may be more appropriate than the other.

A BHC measure acknowledges that some households may choose to spend more on housing in order to enjoy a better quality of accommodation. On the other hand, variations in housing costs may not always reflect differences in the quality of accommodation (for example, geographical differences mean two households could face very different costs for a comparable standard of housing). In this case, an AHC measure is arguably more illuminating.¹

Poverty levels are generally higher when household incomes are measured AHC, as households at the lower end of the income distribution tend to spend a larger share of their income on housing than higher-income households.

1.3 Absolute low income and inflation

An individual is in absolute low income if their household income is below 60% of the median in some base year, adjusted for inflation. DWP's *Households below average income* (HBAI) publication uses 2010/11 as the base year in order to measure absolute low income. This briefing paper follows HBAI and also uses 2010/11 as its base year.

¹ A short summary of the arguments for and against deducting housing costs from household income can be found in DWP, *Households Below Average Income, 2010/11*, 11 June 2012, Appendix 2: Methodology, p266. See also Appendix A in Jonathan Cribb et al, *Living standards, poverty and inequality in the UK: 2017*, Institute for Fiscal Studies Report R129, 19 July 2017, pp77-9

The number and percentage of people in absolute low income depends on how you adjust for inflation. The official poverty statistics presented in the HBAI report for 2016/17 use an absolute low income threshold updated based on the Consumer Prices Index (CPI) measure of inflation.

Editions of HBAI before 2014/15 used the Retail Prices Index (RPI) measure, which tends to show a higher rate of inflation than the CPI. This affected the estimated number and proportion of people counted as being in absolute low income. Annex 4 of the [HBAI Quality and Methodology Information Report for 2014/15](#) compares the trend in absolute low income under both CPI and RPI.

Variations in the inflation experiences of households

Regardless of the choice of inflation index, the absolute low income measure does not account for differences in households' experiences of inflation. Households with different levels of income will have different spending patterns, meaning the cost of living may rise more quickly for some households than for others.

Research funded by the Joseph Rowntree Foundation and conducted by the Institute for Fiscal Studies found that low-income households experienced a higher average annual rate of inflation than richer households over the period 2002/03 to 2013/14. The research estimates that the proportion of people in absolute low income would have been 0.5% points higher in 2013/14 if the threshold was updated based on inflation rates that vary with household income.² More recent data from the Office for National Statistics indicates that higher-income households experienced (if anything) a slightly higher rate of inflation than lower-income households during much of 2017, 2018 and early 2019.³

1.4 Production of poverty statistics

Official figures for the number of people in relative and absolute low income are published by the Department for Work and Pensions (DWP) in its annual *Households below average income* (HBAI) publication. The latest figures are for 2017/18 and were published on 14 June 2019.

The figures in HBAI are derived from the Family Resources Survey, which surveys over 19,000 households in the UK annually. Survey findings are weighted to produce estimates for the whole UK population. **All data in this briefing come from this source unless otherwise stated.**⁴

² A Adams and P Levell, [Measuring poverty when inflation varies across households](#), Joseph Rowntree Foundation, 5 November 2014. Research by the Office for National Statistics (ONS) also found low-income households tend to experience higher rates of inflation than richer households: [Variation in the Inflation Experience of UK Households, 2003-2014](#), 15 December 2014

³ Office for National Statistics, [CPIH-consistent inflation rate estimates for UK household groups: 2005 to 2019](#), 15 August 2018

⁴ Analysis of trends in relative low income by housing tenure in section 7 are based on analysis of survey microdata: Department for Work and Pensions. (2019). *Households Below Average Income, 1994/95-2017/18*. [data collection]. 12th Edition. UK Data Service. SN: 5828, <http://doi.org/10.5255/UKDA-SN-5828-10>

An alternative measure of poverty

The [*Social Metrics Commission*](#) (SMC) has proposed a new measure of poverty, which accounts for differences among household such as costs of childcare and disability, savings and access to assets. The trends in the SMC measure are similar to relative poverty measured after housing costs (AHC), although pensioner poverty is lower on the SMC measure than in the official statistics.⁵ Estimates of the SMC's poverty rates are published on their website.

⁵ Based on analysis in Institute for Fiscal Studies, [Living standards, poverty and inequality in the UK: 2019](#), 19 June 2019

2. Recent trends

2.1 Whole population

In 2017/18, there were 11.1 million people in the UK in relative low income before housing costs (BHC), up from 10.4 million the previous year. 17% of the population were in relative low income BHC.

On an after housing costs (AHC) basis, 14.0 million people were in relative low income, down from 14.3 million the previous year (and the same as the year before that). 22% of the population were in relative low income AHC.

There were 9.5 million people in absolute low income BHC, an increase of 600,000 from the previous year (but similar to the figure from 2014/15). 15% of the population were in absolute low income BHC.

The number of people in absolute low income AHC was 12.5 million, similar to the previous year. The proportion of the population in absolute low income AHC was 19%.

Previously, the proportion of people in relative low income fell between 2009/10 and 2010/11, both on a BHC and AHC basis. This was because

there was a larger decrease in real incomes for households at the middle of the income distribution than for households at the bottom, and the relative low income threshold moves in line with median income.

This decrease in median income between 2009/10 and 2010/11 reflected a decrease in real median earnings. Benefit and tax credit income, on the other hand, fell only slightly in real terms meaning that poor households in receipt of benefits and tax credits saw a smaller fall in their real incomes than was the case for middle-income households.

One group which did not experience a reduction in relative low income following the 2008 economic downturn was working-age adults without children. However, this group is less likely to be in receipt of benefits than pensioners or families with children.⁶

⁶ DWP, [Households Below Average Income, 2010/11](#), 11 June 2012, p46

2.2 Children

3.0 million children were in relative low income BHC in 2017/18, up 300,000 from the previous year. 22% of children were in relative low income BHC.⁷

On an AHC basis, there were 4.1 million children in relative low income, about the same as the previous year. 30% of all children were in relative low income AHC.

The number of children in absolute low income BHC was 2.5 million, an increase of 300,000 from the previous year. 18% of children were in absolute low income BHC.

3.7 million children were in absolute low income AHC, up 200,000 from the previous year. 26% of children were in absolute low income AHC.

⁷ Children are defined here as people aged under 16, or who are aged 16-19, not married or co-habiting and in full-time non-advanced education.

2.3 Pensioners

When analysing pensioner incomes, it is often more useful to look at incomes AHC since around three-quarters of pensioners own their homes (otherwise we may get a misleading impression of the relative living standards of pensioners who do not own their home and so incur significantly higher housing costs). Pensioners are defined as all adults above State Pension age.

2.0 million pensioners were in relative low income AHC in 2017/18, similar to the year before. 16% of pensioners were in relative low income AHC. (On a BHC measure, 2.2 million pensioners were in relative low income. This was around 18% of all pensioners.)

1.6 million pensioners were in absolute low income AHC in 2017/18, 100,000 more than the previous year. 14% of all pensioners were in absolute low income AHC. (On a BHC measure, the number in absolute low income was 1.8 million, 15% of all pensioners.)

2.4 Working-age adults

There were 5.9 million working-age adults in relative low income BHC in 2017/18, 15% of all working-age adults. The number increased by 200,000 on the previous year.

The likelihood of being in low income varies by family status. 18% of adults with dependent children (“working-age parents”) were in relative low income BHC, slightly higher than the previous year (16%). The proportion of working-age adults without children in relative low income BHC remained about the same at 14%. Over the longer term, the trend in poverty rates for those with children has contrasted with the trend for those without children, as discussed below.

Based on incomes AHC, 8.0 million working-age adults were in relative low income in 2017/18. This was 200,000 less than the previous year.

20% of all working-age adults were in relative low income AHC. The rate was higher for working-age parents at 24% (down a little from 26% the previous year), compared to 18% for working-age adults without dependent children.

% of working-age adults in relative low income

Note: figures for 1997/98 to 2001/02 are for Great Britain; figures for 2002/03 onwards are for the UK.

5.2 million working-age adults were in absolute low income BHC, 200,000 more than the previous year. This was 13% of all working-age adults. The rate was 15% for working-age parents and 12% for those without children.

On an AHC basis, the number of working-age adults in absolute low income fell by 200,000 from the previous year to 7.2 million. This was 18% of all working-age adults. The rate of absolute low income AHC was 22% for working-age parents and 16% for those without children.

% of working-age adults in absolute low income

Note: figures for 1997/98 to 2001/02 are for Great Britain; figures for 2002/03 onwards are for the UK.

As can be seen from the charts, over the past twenty years, poverty rates for working-age adults with children have followed a different trend to rates for those without children. Firstly, the likelihood of being in **relative low income** declined during the late 1990s and early 2000s for working-age adults with children, but increased for those without children. One reason for this is the contrast in state support for families with and without children under the 1997-2010 Labour government, as explained by the Institute for Fiscal Studies:

The increase in the generosity of state support for low-income families with children and pensioners stands in stark contrast to the lack of priority in this area attached to the childless working-age population. Indeed, direct tax and benefit reforms under

Labour had almost no net impact on poverty rates among that group.⁸

Poverty trends for working-age parents and those without children diverged again after the 2008 recession. Unlike pensioners or families with children, there was no decrease in relative low income among working-age adults without children after 2007/08. People in this group tend to draw more of their income from earnings and less from benefits than pensioners or families with children, so were particularly affected by real terms falls in earnings following the recession:

Working-age non-parents were the only major demographic group not to see a fall in relative poverty between 2007–08 and 2012–13 (although there was a fall when looking just at the change between 2011–12 and 2012–13; however, this was not significant). This is a group who are, on average, more reliant on earnings and less reliant on benefits than children and pensioners, even when focusing only on low income groups. In 2012–13, benefits made up 88% of household income for the poorest 30% of pensioners, 62% for the poorest 30% of children and 38% for the poorest 30% of working-age non-parents. This helps to explain why they benefited less from the rise in benefits relative to earnings during the recession. In addition, working-age adults without dependent children are relatively likely to be young adults, and [...] adults aged under 30 saw the largest falls in wages and employment rates during the recession.⁹

2.5 Under-reporting of benefit income is likely to inflate poverty estimates

Poverty levels may be somewhat lower than stated in the official statistics once we make adjustment for households under-reporting the amount they receive in benefits.

Estimates of relative and absolute low income are obtained from the Family Resources Survey, which surveys over 19,000 households in the UK each year. Although this is recognised as the best source of data on the distribution of household incomes in the UK, it does not perfectly record all income received by a household. In particular, the survey underestimates the total amount of benefit income received by households compared to administrative data on what the government actually pays out in benefits.

Analysis by the Resolution Foundation, a think tank, indicates that benefit income as recorded in the Family Resources Survey in 2016/17 only came to 82% of actual government expenditure on benefits for private households in the UK. This left an unexplained gap of £37 billion compared to government expenditure, or around 4% of total disposable income reported in the survey. The gap has increased from around 2% of total disposable income at the start of the 2000s.¹⁰

⁸ R Joyce and L Sibieta (2013), [An assessment of Labour's record on income inequality and poverty](#), Oxford Review of Economic Policy, vol. 29, pp. 178–202.

⁹ C Belfield et al, [Living standards, poverty and inequality in the UK: 2014](#), IFS Report 96, 15 July 2014, p80

¹⁰ Adam Corlett et al, [The Living Standards Audit 2018](#), Resolution Foundation Report, 24 July 2018, pp48-54

The under-reporting of benefit income is likely to have the greatest impact on income estimates for households at the lower end of the income distribution, since these households tend to draw a larger share of their total income from benefits. If this is indeed the case, then incomes across the bottom half of the distribution will be higher relative to median income than is reported in the Family Resources Survey. That would mean official estimates for the proportion of people in relative low income are overstated.

How do poverty estimates change when we factor in the missing benefit income?

There is no easy way to correct the survey data so that it balances with the administrative data on benefit expenditure, because we cannot know which households in the survey are under-reporting their income from benefits. Nevertheless, estimates from the Resolution Foundation suggest that once we adjust for the 'missing' benefit income in the Family Resources Survey then 18% of people were in relative low income AHC in 2016/17, compared to an estimate of 22% based on the unadjusted survey data.¹¹

Poverty levels are lower when we account for under-reporting of benefit income

% of people in relative low income after housing costs, GB, 2016/17:
Resolution Foundation estimates

	Headline estimate (unadjusted)	Estimate adjusted for missing benefit income
All people	22%	18%
Children	30%	24%
Working-age adults	21%	18%
Pensioners	16%	11%

Source: Resolution Foundation estimates, published in Adam Corlett et al, *The Living Standards Audit 2018*, July 2018

After adjusting for the missing benefit income, poverty levels are estimated to be lower in every year since 1994/95. What is more, the adjusted data suggest that poverty levels **fell more quickly during the 2000s** than is indicated by the unadjusted data.

¹¹ Ibid, p65

3. Long-run trends since 1961

This section briefly summarises poverty trends over the long-run (since the 1960s) using [data compiled by the Institute for Fiscal Studies \(IFS\)](#).

There was a large increase in the proportion of people in relative poverty during the 1980s, followed by a more gradual decline.

Notes: Years refer to calendar years up and including 1992 and financial years from 1993/94 onwards. Source: Institute for Fiscal Studies (IFS), using data compiled from the Family Resources Survey and Family Expenditure Survey; DWP

The proportion of people in absolute low income, on the other hand, has greatly reduced over the past fifty years because over most of this period growth in incomes outstripped inflation.

Notes: Years refer to calendar years up and including 1992 and financial years from 1993/94 onwards. Source: Institute for Fiscal Studies (IFS), using data compiled from the Family Resources Survey and Family Expenditure Survey; DWP

These overall trends mask marked differences between groups. The proportion of pensioners in poverty is much lower now than during the 1960s, but poverty rates for children and working-age adults are higher than they were 50 years ago. Poverty rates for children, pensioners and working-age adults converged after the economic downturn in 2008 and are currently much closer than has historically been the case.

Notes: Years refer to calendar years up and including 1992 and financial years from 1993/94 onwards. Source: Institute for Fiscal Studies (IFS), using data compiled from the Family Resources Survey and Family Expenditure Survey; DWP

4. Prospects for future years

Projections produced by the Institute for Fiscal Studies (IFS) and Resolution Foundation suggest that the share of children in relative low income will increase sharply between 2015/16 and 2021/22, assuming no change in government policy.¹² These projections were prepared before the publication of the latest poverty estimates.

The Resolution Foundation’s projections suggest child poverty will rise to record levels within the next five years, and will be 6 percentage points higher in 2023/24 than in 2016/17: equivalent to an extra 1 million children in poverty. The Resolution Foundation have also modelled the effect of various benefit changes on child poverty – finding that child poverty is likely to rise without “serious new spending or the cancellation of planned cuts”.

Changes for other groups are forecast to be less dramatic, as can be seen in the Resolution Foundation’s chart below.¹³

Notes: GB only before 2002-03.

Source: RF analysis of DWP, *Households Below Average Income*, and RF projection

4.1 Regional differences

The IFS earlier published projections by country and region of the UK. These are presented as three year averages to make the estimates more robust. So instead of comparing projected rates in 2021/22 with 2015/16, the regional analysis compares the three years 2019/20-2021/22 with the three years 2013/14-2015/16. Current data on poverty levels by region are presented in [section 9](#) of this paper.

¹² A Hood and T Waters, *Living Standards, Poverty and Inequality in the UK: 2017-18 to 2021-22*, IFS Report R136, 2 November 2017.

Resolution Foundation, *Living Standards Outlook 2019*, February 2019

¹³ Resolution Foundation, *Living Standards Outlook 2019*, February 2019

The share of the total population (and the share of children) in relative low income after housing costs is expected to increase across all regions over this period. The projected increase in poverty tends to be larger for regions which already have higher rates of poverty, with the notable exception of London.

Projected increase in rate of relative low income by region (% points)

2013/14-2015/16 compared with 2019/20-2021/22, based on income after housing costs

The pattern of projected increases across regions partly reflects the extent to which poorer households in each region are dependent on income from earnings rather than benefits. The effect of benefit cuts over this period will be more pronounced in regions where benefits tend to comprise a larger share of total income for poor households. But where poor households draw a larger share of their income from earnings, then these households will be more able to benefit from expected growth in real earnings.

In the absence of any official macroeconomic forecasts by region from the Office for Budget Responsibility, these regional projections assume average earnings and rents grow at the same pace across all regions over the relevant period. The IFS acknowledges this a simplistic assumption and is highly uncertain. Nevertheless, it represents a “broadly central expectation on the basis of recent historical patterns”.

4.2 Limitations

In general, the projections obviously come with much uncertainty. They build on macroeconomic forecasts produced by the Office for Budget Responsibility (OBR) and demographic projections from the Office for National Statistics (ONS), which are themselves uncertain.

The projections do not take into account the latest poverty estimates for 2017/18 as published in the latest *Households below average income* release. Nor do they account for more recent economic and demographic forecasts, including those made by the OBR at the time of the 2019 Spring Statement.

The projections offer an estimate of future poverty levels in a scenario where policy remains unchanged. They do not account for possible behavioural responses to tax and benefit changes. If changes lead to some individuals entering employment or increasing their earnings, actual trends may be more favourable than the projections suggest.

5. Poverty dynamics

Households may move in and out of poverty from year to year. The figures presented earlier in this note are a snapshot of the number of people in poverty at one point in time and do not tell us how many people are entering or exiting poverty each year, or for how long someone experiences poverty. For information on the duration of poverty we need to turn to surveys which track individuals over a number of years.

5.1 Persistent poverty

An individual is defined as being in persistent low income **if they are in relative low income for at least three out of the past four years**.¹⁴

Between 2013 and 2017, 9% of individuals were in persistent low income before housing costs (BHC) and 13% were in persistent low income after housing costs (AHC), based on data from the Understanding Society survey.¹⁵

- On an AHC basis, children were most likely and pensioners were least likely to experience persistent low income compared to other population groups, as shown in the table below.
- On a BHC basis, children were most likely and working-age adults were least likely to experience persistent low income. Since most pensioners own their own homes, their housing costs tend to be lower than for other groups.

% of people in persistent low income: UK, 2013/14 to 2016/17

	Persistent low income		<i>Compared to % of people in relative low income, 16/17*</i>	
	BHC	AHC	BHC	AHC
All individuals	9%	13%	15%	19%
Children	11%	20%	19%	26%
Working-age adults	7%	12%	13%	18%
Pensioners	11%	11%	16%	16%

Source: DWP, *Income dynamics*, Tables 1 and M.9 (based on Understanding Society survey)

* These figures are not the official estimates for the proportion of people in relative low income; rather they are provided here for comparative purposes only. Official estimates for relative low income are collected via the *Family Resources Survey* and are set out in section 2.

These statistics are classed as 'experimental statistics' meaning they are still in development. The figures are collected via the Understanding Society survey, which gives a slightly lower estimate for the proportion of people in relative low income in 2016/17 than the Family Resources Survey (the main source of statistics on relative and absolute low income).

¹⁴ This was the definition used in the Child Poverty Act 2010, which set targets (later removed by the Welfare Reform and Work Act 2016) for reducing child poverty as counted using four different poverty measures, including persistent low income.

¹⁵ Figures are published in DWP, *Income Dynamics, 2010 to 2017*, 28 March 2019

Who experiences persistent low income?

The likelihood that an individual is in persistent low income varied according to the employment status of the family and housing tenure, among other factors. Rates of persistent low income were particularly high for the following groups (based on people's circumstances at the start of the four year period 2012/13 to 2015/16):¹⁶

- 19% of individuals living in families **where no adults worked** were in persistent low income BHC and 24% AHC.
- 18% of individuals in **social rented** accommodation were in persistent low income BHC and 36% AHC.
- Although the proportion of people in **private rented** accommodation in persistent low income BHC was similar to the average at 10%, the proportion increased to 25% based on incomes AHC.
- 19% of adults **with no qualifications** were in persistent low income BHC and 23% AHC.
- Levels of persistent low income were higher in households where the head of household was from certain ethnic groups: 14% of people from a Black/ African/ Caribbean/ Black British background were in persistent low income BHC and 29% AHC. For people from an Asian / Asian British background, the proportions were at 18% BHC and 26% AHC.
- 20% of **children in lone parent families** were in persistent low income BHC and 36% AHC.
- In **families with three or more children**, 20% of children were in persistent low income BHC and 31% AHC.

The rate of persistent low income for families with children and pensioners decreased from the start of the 1990s. However, the rate has increased for single working-age people without children. This is similar to the trends in the proportion of people in relative low income in any one year, as discussed in section 2 of this briefing paper.¹⁷

Other estimates: EU-SILC survey

The figures above are taken from DWP's *Income Dynamics* publication, which is based on the Understanding Society survey. This survey has been running since 2009/10 and replaced the older British Household Panel Survey. Data from the older survey were formerly published in a DWP release, *Low Income Dynamics*.¹⁸

Current data on persistent low income is also collected through the *European Union Statistics on Income and Living Conditions* (EU-SILC) survey.¹⁹ This source similarly indicates **around 8%** of the UK

¹⁶ For some individuals, their circumstances will have changed over this period. For example, the group of individuals living in families where no one was in work in 2012/13 will include individuals who were working in subsequent years.

¹⁷ DWP, *Income Dynamics, 2010 to 2017*, 28 March 2019, Table 2.1 and DWP, *Low-Income Dynamics: 1991-2008 (Great Britain)*, September 2010, Table 8.1

¹⁸ The last release was published in September 2010 and provided statistics for four year periods from 1991-1994 up to 2005-2008.

¹⁹ Eurostat, *Income and Living Conditions* database, [Persistent at-risk-of-poverty rate by sex and age - EU-SILC survey](#), Table ilc_li21. See also ONS, [Persistent Poverty in the UK and EU: 2017](#), 6 June 2019.

population were in persistent low income BHC in 2016, although it defines income slightly differently to Understanding Society and uses a different definition for persistent low income. Specifically, the EU-SILC survey counts someone as in persistent low income if they are in relative low income *in the current year* and in at least two out of the three preceding years, based on household income before housing costs.²⁰

5.2 How many people experience poverty?

Data from the EU-SILC survey suggest that just under a third (31%) of the total population were in relative low income BHC in at least one of the four years from 2013 to 2016.²¹

Previous ONS analysis showed that people aged 65 and over were more likely than younger age groups to have been in relative low income in at least one of the four years 2011 to 2014. Single parent and single adult households were more likely to have experienced relative low income than households with two or more adults.²²

5.3 Poverty entry and exit rates

Understanding Society provides estimates of the proportion of people entering and exiting low income between one year and the next. It uses a strict definition of entry and exit so that the estimates “only include ‘clear’ transitions” into and out of low income. Thus only people who move from having an income above the relative low income threshold to having an income **at least 10% below** the threshold in the following year are counted as entering poverty. Similarly, for someone to be counted as exiting poverty, they must go from having an income below the threshold to having an income **at least 10% above** the following year’s threshold. Figures refer to income before housing costs.²³

- On this basis, around a third of the population (35%) in relative low income in 2015/16 were no longer in relative low income the next year (the “exit rate”).
- Of those people not in relative low income in 2015/16, around 6% were in relative low income in 2016/17 (the “entry rate”).

The exit rate is calculated as a percentage of the population in relative low income while the entry rate is calculated as a percentage of the population *not* in relative low income. Since there are many fewer people in poverty than there are people not in poverty, the exit rate is much higher than the entry rate.

ONS analysis of the EU-SILC survey reports higher poverty entry and exit rates, in part because it does not use as strict a definition of entry and exit. Instead, if someone moves from below the relative low income threshold in one year to just above the threshold in the next, then that

²⁰ In the Understanding Society figures, an individual may be counted as in persistent low income even if they are not in relative low income in the current year.

²¹ Eurostat, *Income and Living Conditions* database, [Distribution of population by number of years spent in poverty within a four-year period](#), Table ilc_li51

²² ONS, [Persistent Poverty in the UK and EU: 2017](#), 6 June 2019.

²³ DWP, [Income Dynamics, 2010 to 2017](#), 28 March 2019

is counted as an exit and similarly for entries. Based on this source, between 2016 and 2017:²⁴

- Around two-fifths of the population (42%) who were in relative low income in one year were no longer in relative low income the next year.
- Of those who were not in relative low income in the first year, around 9% were in relative low income in the next.

Figures refer to incomes BHC. Older data for the proportions of people entering and exiting poverty over the period 1991-2008 can be found in the DWP [Low-Income Dynamics](#) publication.

5.4 Factors associated with entering or exiting poverty

Several reports discuss the reasons or events associated with people entering or exiting poverty. These include:

- DWP, *An evidence review of the drivers of child poverty for families in poverty now and for poor children growing up to be poor adults*, January 2014 (discussed further below)
- ONS, *Persistent poverty in the UK and EU: 2017*, 6 June 2019
- Conor D'Arcy and David Finch, *The Great Escape? Low pay and progression in the UK's labour market*, Resolution Foundation report for the Social Mobility Commission, October 2017
- DWP, *Child poverty transitions: exploring the routes into and out of poverty 2009 to 2012*, June 2015
- ONS, *Poverty and employment transitions in the UK and EU: 2007-2012*, March 2015
- J Nelson, K Martin and G Featherstone, *What Works in Supporting Children and Young People to Overcome Persistent Poverty? A Review of UK and International Literature*, Office of the First Minister and Deputy First Minister (OFMDFM) of Northern Ireland, May 2013
- DWP, *Low-Income Dynamics: 1991-2008 (Great Britain)*, September 2010 (in particular see Tables 10.1 and 11.1)

In particular, the DWP [Evidence Review](#) investigated the extent to which different factors contribute to children's chances of exiting or remaining in relative low income. The Review considered firstly the factors which make it harder for families currently in poverty to exit it in the short term, and secondly the factors which increase children's chances of being in poverty as adults.

The relative importance of various factors were assessed by considering their (i) Certainty – does the factor have an effect; (ii) Strength – how big is the effect; (iii) Coverage – how many children are affected. These are summarised in the tables below, although individual factors are discussed in depth in Chapter 4 of the Review.²⁵

²⁴ ONS, *Persistent Poverty in the UK and EU: 2017*, 6 June 2019

²⁵ HM Government, *An evidence review of the drivers of child poverty for families in poverty now and for poor children growing up to be poor adults*, Cm 8781, January 2014, pp6-8

The Review found that the most important factors standing in the way of families exiting poverty now were those factors contributing to a lack of sufficient income from parental employment:

Table 1: Relative influence of factors on length of child poverty spell

Factor	Certainty	Strength	Coverage
Long-term Worklessness & Low Earnings	High	High	High
Parental Qualifications	High	High	High
Family Instability	High	Medium	Medium
Family Size	High	Medium	Medium
Parental Ill Health and Disability	Medium	Medium	Medium
Drug & Alcohol Dependency	High	High	Low
Child Ill Health	Medium	Low	Low
Housing	Low	Low	Medium
Debt	Low	Low	Medium
Neighbourhood	Low	Low	Medium
Educational Attainment	N/A	N/A	N/A
Non-Cognitive Development	N/A	N/A	N/A
Home Learning Environment	N/A	N/A	N/A

Although educational attainment does not have a bearing on poverty in the short term, it was identified as the main driver that causes poor children to become poor adults:

Table 2: Relative influence of factors on future poverty

Factor	Certainty	Strength	Coverage
Educational Attainment	High	High	High
Parental Qualifications	High	Medium	High
Childhood Poverty	Medium	Medium	High
Home Learning Environment	Medium	Medium	High
Non-Cognitive Development	Medium	Medium	High
Parental Ill Health and Disability	Medium	Medium	Medium
Child Ill Health	High	Medium	Low
Long-term Worklessness & Low Earnings	Medium	Low	High
Family Size	Medium	Low	Medium
Neighbourhood	Medium	Low	Medium
Family Instability	Medium	Low	Medium
Drug & Alcohol Dependency	Low	High	Low
Housing	Low	Low	Medium
Debt	Low	Low	Medium

5.5 Government indicators of disadvantage affecting families and children

The Government set out various indicators to be used “to track progress in tackling the disadvantages that affect families’ and children’s lives” in an April 2017 policy paper, [Improving Lives: Helping Workless Families](#).

The indicators fall into nine areas. Six parental indicator areas track worklessness and “associated disadvantages”:

- parental worklessness
- parental conflict
- poor parental mental health
- drug and alcohol dependency
- problem debt
- homelessness

Three indicator areas look at outcomes for children and young people:

- early years
- educational attainment
- youth employment

Statutory “life chances” indicators relating to children in workless households in England and educational attainment of children at the end of Key Stage 4 in England, as introduced by the Welfare Reform and Work Act 2017, come under the parental worklessness and educational attainment indicator areas respectively.²⁶

Data on each indicator is published as part of a DWP [evidence base](#) for the *Improving Lives: Helping Workless Families* publication. A detailed [Analysis and Research Pack](#) looks in depth at the characteristics and outcomes for children living in families where no parent is in work and for children experiencing the other kinds of disadvantage reflected in the indicators. It also provides a concise summary of research literature on the relevance of and associations between different indicators.²⁷

²⁶ For further background information on these statutory indicators, see the Library briefing paper prepared for Second Reading of the [Child Poverty in the UK \(Target for Reduction\) Bill, 2016-17](#) (1 February 2017).

²⁷ DWP, [Improving Lives: Helping Workless Families – Analysis and Research Pack](#), 4 April 2017

6. Poverty and employment

People living in workless families are much more likely to be in poverty than people living in families where at least one person works. Around 38% of working-age adults living in workless families were in relative low income BHC in 2016/17, compared to 10% in families where at least one adult was in work.

Nevertheless, working-age adults living in families where at least one person is in work make up the majority (56%) of all working-age adults in relative low income. This reflects the fact there are many more working than workless households to begin with: 84% of working-age adults live in families where at least one person works.

The same holds true for child poverty: 56% of children in workless families were in relative low income BHC compared to 17% in families where at least one person works. But since there are many more working than workless families, children living in working families comprise the majority (69%) of children in relative low income.

% of people (all ages) in relative low income
By economic status of adults in the family: UK, 2017/18

The risk of relative low income for children in workless families is lower than at the end of the 1990s, as shown in the chart on the left below. Following the 2008 recession, there was a sharp reduction in the proportion of children in workless families in relative low income. Although real incomes from employment fell after the recession, benefit income (which is the most important income source for workless families) was more stable. However, the past few years have seen a clear break from the longer term trend as the proportion of children in workless families who are in relative low income increased from 38% in 2013/14 to 56% in 2017/18.

For families where at least one adult is in work (“working families”), the proportion of children in relative low income has remained broadly similar over the past twenty years, although it appeared to increase a little in 2017/18, to 17%.

During this period, the total population of children living in working families has increased and the population living in workless families has decreased. As the total number of children living in workless families has decreased along with the risk of poverty for these children, children in working families have formed an increasing share of all children in poverty. This is shown in the chart on the right.

Note: figures for 1994/95 to 2001/02 are for Great Britain; figures for 2002/03 onwards are for the UK

Looking at the working-age adult population, the share of individuals in poverty who live in working families has also increased over the past decade but changes are more muted than for children. The risk of poverty for individuals in both working and workless families remained fairly steady until the 2008 recession. After 2008, there was a reduction in the proportion of working-age adults in workless families who were in relative poverty.

Note: figures for 1994/95 to 2001/02 are for Great Britain; figures for 2002/03 onwards are for the UK

7. Poverty and housing tenure

People living in social rented or private rented accommodation are more likely to be in relative low income after housing costs (AHC) than people who own their home. Around 47% of people in the social rented sector and 35% of people in the private rented sector were in relative low income AHC in 2017/18.

The lack of housing costs for people who own their homes outright means that fewer owner occupiers are counted as being in poverty based on incomes AHC than incomes before housing costs (BHC).²⁸

% of people (all ages) in relative low income, by housing tenure

UK, 2017/18

Around half of **children** living in both the social and private rented sectors were in relative low income AHC in 2016/17.

% of children in relative low income, by housing tenure

UK, 2017/18

Although the proportion of owner occupiers in relative low income AHC is much smaller than the proportion of private or social renters, people who own their own home still formed a third of people (and a quarter of all children) in relative low income AHC in 2016/17. This is because the overall population who are owner occupiers is larger than the population living in the private or social rented sectors.

The rate of relative low income within each sector is lower than it was at the end of the 1990s, as shown in the first of the charts below. However, over the same period the private rented sector has greatly increased in size, with the result that a higher share of all poor people are now living in the private rented sector. Around 12.5 million people

²⁸ Housing costs include mortgage interest payments but exclude mortgage capital repayments.

in the UK were living in private rented housing in 2017/18, up from 5.0 million in 1997/98.²⁹ This can be attributed to a fall in the proportion of households who own their own home, but also to reduced availability of social rented accommodation for poorer households.³⁰ As the overall size of the private rented sector has grown, the number of people in relative low income AHC living in the private rented sector has increased from 2.1 million to 4.3 million.

Just under a third (31%) of all people in relative low income AHC lived in the private rented sector in 2018/19, similar to the proportion who were owner occupiers or in the social rented sector. This compares to 15% of people in relative low income AHC renting privately in 1997/98.

The risk of poverty for different tenure types has decreased since the 1990s...

% of people (all ages) in relative low income AHC

... but as the total private rented sector has grown, so has the number of poor people who are private renters

% of people in relative low income AHC who live in different tenure types

Figures for 1994/95 to 2001/02 are for Great Britain; figures for 2002/03 onwards are for UK. Source: DWP *Households below average income*, 2016/17 release and microdata analysis

²⁹ Estimates based on *Households below average income* microdata and StatXplore analysis
³⁰ Robert Joyce et al, *The cost of housing for low-income renters*, Institute for Fiscal Studies report R132, 13 October 2017; see also Helen Barnard et al, *UK Poverty 2018*, Joseph Rowntree Foundation Analysis Unit, 4 December 2018, p41

8. Poverty and disability

Poverty rates are higher among families where at least one member is disabled, compared to families where no one is disabled. In 2017/18:

- The proportion of people in relative low income before housing costs (BHC) was 21% for families where someone is disabled, compared to 15% for people living in families where no one is disabled.
- The rate of relative low income after housing costs (AHC) was 26% for families where someone is disabled, compared to 20% for those where no one is disabled.

People living in families where someone is disabled comprised around two-fifths of the population in relative low income in 2017/18, both BHC and AHC. This compares to 33% of people across the total UK population living in families where someone is disabled.

However, these figures take no account of the **additional living costs** that people with disabilities might face. If we could take these costs into account then it is very likely that more disabled people would be counted as living in poverty, but this is complicated by the fact that costs vary widely both in nature and level. Nevertheless, the measure of income used to calculate the relative low income threshold does include benefits paid as a contribution towards the extra costs of disability: Disability Living Allowance (DLA), Attendance Allowance (AA) and Personal Independence Payment (PIP). Around 10% of the total UK population live in families in receipt of disability benefits. Excluding these benefits from income means more families with a disabled member are counted as being in relative low income:

% of people in relative low income*, by disabled people in family

* Excluding DLA, AA, PIP from household income; UK, 2017/18

Using this adjusted measure of income, then people living in families where someone is disabled made up around 41% of the total population in relative low income BHC and 39% AHC.

Poverty rates are higher for **children** living in families where someone is disabled than for the population as a whole. Based on income excluding disability benefits, the rate of relative low income for children living in families where someone is disabled was 27% BHC and 35% AHC. Children in families with a disabled member were more than twice as likely to experience **low income and material deprivation** (20%) than children in families where no one is disabled (8%). [Section 11](#) provides further information on material deprivation measures.

9. Regional poverty data

9.1 Relative low income

The proportion of individuals in relative low income BHC was highest in Wales, the West Midlands, the North West, the North East and Yorkshire and Humber (all 19%) over the three year period 2015/16 to 2017/18 and was lowest in the South East and South West of England (both 13%). On an AHC basis, the proportion is highest in London (28%). A much higher people in London are counted as being in poverty based on incomes AHC owing to the high cost of housing relative to other parts of the UK. Data on poverty trends by region are [published alongside this briefing paper](#).

% of people (all ages) in relative low income by region, 2015/16 to 2017/18

Individuals living in relative low income by region

Three year average for 2015/16 to 2017/18

	All people				Children			
	Number (millions)		Percentage		Number (millions)		Percentage

Source: DWP, *Households Below Average Income, 2016/17*, Tables 3.17ts, 3.18ts, 4.16ts, 4.17ts

Poverty estimates by country and region are subject to greater sampling variability than estimates for the UK as a whole, since the number of

households surveyed is smaller. Therefore these regional estimates are presented as three year averages so that the figures are less volatile.

The Institute for Fiscal Studies has produced projections for the proportion of people in relative and absolute low income by region in the three years ending 2021/22. The projections are discussed in [section 4.2](#) of this paper.³¹

9.2 Persistent low income

The prevalence of persistent low income also varies by region. As discussed in [section 5.1](#), someone is in persistent low income if they have been in relative low income for three out of the past four years.

On a BHC basis, Yorkshire and the Humber had the highest rate of persistent low income (13%) and the South East and East had the lowest rate (both 6%) during the period 2013/14 to 2016/17.

On an AHC basis, London had the highest rate (18%).³²

% of people (all ages) in persistent low income by region, 2013 to 2017

³¹ A Hood and T Waters, [Living Standards, Poverty and Inequality in the UK: 2017-18 to 2021-22](#), IFS Report R136, 2 November 2017

³² DWP, [Income Dynamics, 2010 to 2017](#), 28 March 2019, Table 2.2

10. Constituency and local area data – child poverty

The official source for poverty statistics for the UK is the annual *Households below average income* (HBAI) report, published by the Department for Work and Pensions and based on data from the Family Resources Survey, but this only provides data at the national and regional level. Unofficial estimates for **child poverty** by local area have been published by [HMRC](#) and [End Child Poverty](#).

Both the HMRC and End Child Poverty figures attempt to measure the proportion of children falling under an income threshold that is broadly analogous to the “relative low income” threshold in HBAI, although income is defined slightly differently in the HMRC case. Both sets of estimates are based on benefits data, at least in part.

The latest End Child Poverty estimates are for 2017/18 while the latest HMRC figures are for August 2016. HMRC presents estimates on a before housing costs (BHC) basis only, but End Child Poverty also reports estimates based on income after housing costs (AHC).

10.1 End Child Poverty estimates

The End Child Poverty figures are calculated by academics at the Centre for Research in Social Policy at Loughborough University.

They have recently changed their methodology, to correct for issues with HMRC statistics outlined below and account for complications in estimation that come with the introduction of universal credit.³³ They have developed a ‘small area estimation’ approach, using the Office for National Statistics’ Labour Force Survey along with administrative data to consider the relationship between the risk of poverty for households in the survey and the socioeconomic and demographic characteristics of their area. In other words, these are credible estimates of relative low income child poverty in each area but may not be accurate for each area.

Estimates for [May 2019](#) are published on the End Child Poverty website – with figures for local authorities, constituencies and wards, AHC and BHC.³⁴

An [interactive map](#) shows the estimated number and proportion of children in relative low income AHC by constituency.³⁵

³³ For more details as to how the estimates are constructed, see Juliet Stone et al, [Local indicators of child poverty-explanatory note](#), Centre for Research in Social Policy, Loughborough University, April 2019

³⁴ Note that constituency figures for Scotland are based on Scottish (rather than Westminster) parliamentary constituencies.

³⁵ <http://www.endchildpoverty.org.uk/poverty-in-your-area-2019/> [accessed 27 June 2019]

10.2 HMRC estimates

The HMRC figures are derived from benefits and tax credits data. Specifically, they show the proportion of children living in families in receipt of out of work means-tested benefits, or living in families in receipt of tax credits with reported income less than 60% of the median.

However, at the national level the HMRC figures overestimate poverty in families in receipt of out-of-work benefits, since all of these families are assumed to be in poverty. Similarly, they underestimate poverty in families where someone is in work compared to the official figures from HBAI. Therefore depending on local circumstances it is possible that **estimates for individual constituencies could be substantially different from the actual value.**

The latest HMRC estimates are for [August 2016](#). Contrary to the trend indicated in HBAI, these suggest the total number of children in low-income families falling over recent years. The fact the figures are moving in the opposite direction from the official HBAI figures gives further reason to think they may not be a reliable indicator for local areas.

Figures for August each year back to 2006 are available via the following links: [2015](#); [2014](#); [2013](#); [2012](#); [2011](#); [2010 and previous](#).

11. Material deprivation

Poverty may be defined in other ways besides having a low household income. Another approach is to consider if a household is materially deprived, meaning they lack the ability to access key goods or services.³⁶

DWP's *Households below average income* report includes data on children experiencing both low income and material deprivation, where 'low income' means a household income below 70% of the median.³⁷ Also included are figures for pensioners experiencing material deprivation, for either financial or non-financial reasons.

1.6 million **children** were in *low income and material deprivation* in 2017/18, 12% of children in the UK. The proportion has decreased from around 13% in 2014/15, having remained roughly the same between 2010/11 and 2014/15. Figures prior to 2010/11 were based on a different set of deprivation indicators and are not comparable.

The chart shows the proportion of all children (not just those with low household incomes) lacking key goods or services:

³⁷ Library Research Paper 04/23, [Poverty: Measures and Targets](#), provides background information on the development of the combined low income and material deprivation measure.

pensioners in the UK. This is about the same as the previous year but is down from 10% in 2009/10.

For pensioners, the material deprivation measure includes items lacking for non-financial reasons (for example, because of ill health).

Methodology

21 indicators are used to assess material deprivation among families with children, covering access to different goods and services. The indicators were selected using various analytical techniques to determine the best discriminators between those families that are deprived and those that are not. The *Family Resources Survey* asks respondents whether they have each item and, if not, whether this is because they do not want them or cannot afford them. The questions are reviewed regularly to ensure they remain relevant.

A different suite of 15 indicators is used to assess material deprivation for pensioners. In this case, material deprivation extends to items lacking for either financial or non-financial reasons; for example, respondents are asked whether they lack the item due to reasons such as health/disability, if it is too much trouble or tiring, or if they have no one to help them or do the activity with.

The deprivation indicators are attributed different weights and respondents are counted as in material deprivation when they score above a certain threshold. Further details of the methodology can be found in the HBAI [Quality and Methodology Information Report](#).

12. Minimum Income Standards

Another way of looking at poverty is to consider what income a family needs to meet some minimum acceptable standard of living, known as the “budget standards” approach. This obviously involves some judgement about what constitutes minimum needs. Successive governments have argued there is no single, objective way of determining what constitutes a minimum acceptable income for a particular person or family, although independent researchers have made a number of attempts. Section 2 of Library Research Paper 13/1, [Welfare Benefits Up-rating Bill, 2013](#), gives an overview of the debate.

One such attempt is a major annual research project funded by the Joseph Rowntree Foundation, which estimates [Minimum Income Standards](#) (MIS) for different household types in the UK. This involves in-depth consultation with members of the public, combined with expert knowledge, to identify the level of income required to meet a minimum acceptable standard of living: “having what you need in order to have the opportunities and choices necessary to participate in society.” The first findings were published in 2008 and are updated each year.³⁸

For most household types, the MIS is well above the relative low income threshold. This suggests that even if someone is not counted as being in relative low income, their income may still be too low for them to have what is considered a minimum acceptable standard of living:

Minimum Income Standards (MIS) for 2018 compared with threshold for relative low income in 2017/18: UK, £ per week

Threshold for relative low income is 60% of median income

	Single, working age	Couple, pensioner	Couple, 2 children	Lone parent, 1 child
Before housing costs				
Relative low income threshold	£204	£304	£426	£264
MIS excluding childcare and council tax	£288	£364	£544	£376
<i>% difference</i>	<i>41%</i>	<i>20%</i>	<i>28%</i>	<i>42%</i>
After housing costs				
Relative low income threshold	£152	£262	£367	£204
MIS excluding childcare, council tax, water rates, rent	£191	£273	£444	£282
<i>% difference</i>	<i>26%</i>	<i>4%</i>	<i>21%</i>	<i>38%</i>

Note: income figures are equalised to take account of household needs, which means that the median is higher for larger households. The figures for families with children assume that all children are aged under 14 years.

Source: A Davis, D Hirsch, M Padley and C Shepherd, [A Minimum Income Standard for the UK 2008-2018](#), 2 July 2018; DWP [Households below average income, 2017/18](#), Table 2.2db

When income is measured BHC, the MIS is higher than the relative low income threshold (based on figures for 2017/18) for each of the four household types in the above table. Based on income AHC, the MIS is similar to the relative low income threshold for pensioner couples, but is

³⁸ A Davis, D Hirsch, M Padley and C Shepherd, [A Minimum Income Standard for the UK in 2018](#), Joseph Rowntree Foundation, 2 July 2018

considerably higher for the other three household types in the table. The 2015 MIS report suggests that “the more meaningful comparison is between net MIS budgets and income after housing costs” given the difficulty in quantifying the ‘minimum’ cost of housing.

Number of people with income below the standard

Nearly 19 million people had income below the MIS in 2016/17, up from 16.5 million in 2008/09. The share of the population with income below the MIS increased from 27% to 29%.³⁹

More people also had an income substantially below the MIS (less than 75% of the MIS), up from 10.2 million in 2008/09 to 10.8 million in 2016/17.

Children are much more likely to have income below the MIS than older age groups: 42.5% of children lived in households with income below the MIS, compared to 28.7% of working-age adults and 16% of pensioners. For all groups, the likelihood of having income below the MIS has increased since 2008/09.

How has the standard changed over time?

The increase in the number of people with income below the MIS occurred between 2008/09 and 2013/14, with the number falling back slightly in the following two years to 2015/16. The same was true of the number of people with income below 75% of the MIS. However, the proportion of people in relative low income has followed a different pattern, decreasing between 2008/09 and 2013/14 but then increasing again (both before and after housing costs).

These contrasting trends can be explained by the fact that the relative low income threshold **is set with reference to median income**, which is not the case for the MIS. After adjusting for inflation, median income was lower in 2013/14 than in 2008/09, which pushed down the threshold below which someone is counted as in relative low income. Meanwhile the income required to meet a minimum acceptable standard of living, as measured by the MIS, increased. So while fewer people were below the relative low income threshold, more people were below the MIS threshold. Since 2013/14, the situation has reversed as median incomes have increased faster than the MIS.⁴⁰

The main reason why the MIS has increased faster than CPI inflation since 2008 is likely to be **a rise in the prices of goods and services** required for a minimum acceptable standard of living. (Some of the increase is also due to changes in what goods and services are included in the MIS calculation.) The CPI looks at average spending patterns across all households, but the MIS looks at the cost of a collection of more basic goods and services and does not include ‘luxury’ items. Thus the MIS puts more weight on certain items that have risen significantly faster than the overall CPI since 2008, including public transport,

³⁹ M Padley, L Valadez-Martinez and D Hirsch, [Households below a Minimum Income Standard: 2008/09-2016/17](#), Joseph Rowntree Foundation, 6th February 2019

⁴⁰ Ibid, section 3, pp14-18

domestic fuel and food. The relative low income threshold on the other hand does not bear any relation to prices.⁴¹

Another difference between the MIS and the relative low income measure is **how they account for household size and composition**. The proportion of people in relative low income is measured with reference to *equivalised* household incomes, in order to compare living standards between households of different sizes or compositions. The equivalisation process uses a standard scale to compare between households of different sizes. For the MIS, however, annual income requirements for each household type are calculated separately so there is no fixed ratio that relates the MIS for a single adult, say, to that for a couple household. The MIS calculation also distinguishes between pensioner and non-pensioner households. Compared to the MIS research, the standard equivalisation scales in the official statistics “underestimate the relative cost of each additional child and also underestimate the cost of a lone parent family compared to a couple family”.⁴²
