Headline facts and figures

Headline figures for Wave 24 of the survey:

Number of children (17 – 19 May 2021)	The total number of children looked after (CLA) was 3% higher than the same time in 2019-20 and the total number of children on a child protection plan (CPP) was 6% lower.
Contact in the last four weeks (19 April – 16 May 2021)	A large proportion of CLA, children on a CPP and other children in need (CIN) have been in contact with a social worker in the last four weeks (67%, 94% and 62% respectively).
Social worker and residential care worker availability (17 – 19 May 2021)	<p>The proportion of social workers not working due to coronavirus (COVID-19) has remained low with 2% of local authorities reporting over 10% of social workers unavailable due to coronavirus (COVID-19) in Wave 24.</p> <p>The proportion of local authorities reporting over 10% of their residential care staff unable to work due to coronavirus (COVID-19) has decreased to the lowest levels since the survey began to 3% in Wave 24. Note that some local authorities have small residential care workforces and therefore a small change in the number of staff available may result in a large change in the proportion unavailable.</p>
Referrals (03 – 09 May 2021)	The total number of referrals during Wave 24 was 1% lower than the usual number at that time of year.
Looked after children	The total number of children who started to be looked after reported in waves 1 to 24 of the survey was 9,670. This is around 29% lower than the same period in 2017-20.

Background

Survey

The Department for Education (DfE) established a survey of local authorities in England to help understand the impact of the coronavirus (COVID-19) outbreak on Children's Social Care. Local authorities were asked to report to DfE every two weeks with the exception of four weeks between waves 7 and 8 (over the summer holidays) and waves 16 and 17 (over the Christmas holidays). From April 2021 the survey became a monthly return with the questions remaining the same.

Each survey return is referred to as a 'wave' in this publication, the dates that each wave refer to and the questions asked can be found in Annex A. Details on the number of local authorities that responded can be found in Annex B. Local authorities were asked to report on the following areas:

- Contact with children supported by the local authority Children's Social Care
- Children's Social Care workforce
- System pressures

Previous publications from the survey¹ contain analysis of questions that have been removed from the survey and open text questions that are not repeated here.

¹ [Vulnerable children and young people survey](#)

Summary of data

Total number of children supported by local authority Children's Social Care

Local authorities were asked to report the total number of Children Looked After (CLA), children on a Child Protection Plan (CPP) and other Children in Need (CIN). The number of other CIN has not been included in this report due to data quality issues.

In Wave 24 the total number of CLA was 3% higher than the same time in 2019-20 and the total number of children on a CPP was 6% lower than the same time in 2019-20. Please note that waves 23 and 24 are not comparable to previous waves as comparator data from April 2020 is not yet available from the annual CIN and CLA collections. Therefore while waves 1-22 are compared to data from one year ago, from Wave 23 onward the data is compared to two years ago. Given over recent years the total number of CLA has been gradually increasing and the total number of CPP has been gradually decreasing, the data received in the survey may be a continuation of those trends; using an older comparator in waves 23 and 24 makes the difference appear larger than it did in Wave 22. If March 2020 were used as the comparator, the total number of CLA and CPP in Wave 24 would be +1% and -5% respectively.

Figure 1: Difference in the total number of CLA and children on a CPP compared to the same time in 2019-20

Notes:

'W1' refers to Wave 1 and so on.

Percentages rounded to the nearest whole number.

See Annex B for the number of local authorities that responded to the question per wave.

Contact with children supported by local authority Children’s Social Care

From Wave 3 of the survey, a new question was added which asks how many of CLA, children on a CPP and other CIN have been seen or contacted by their social worker in the last four weeks.

Contact is defined as communication that has taken place with the child/young person, including both face to face visits and remote communication, such as telephone calls or other types of messaging.

Local authorities were previously asked how many cases had been reviewed and how many children had been contacted by their social worker in the last two weeks. These questions were removed from the survey from Wave 10 because findings remained stable, face to face visits were resuming and carried out within statutory timescales, and to reduce the burden on local authorities. A summary of responses from these questions can be found in previous publications¹.

In Wave 24, 67% of CLA, 94% of children on a CPP and 62% of other CIN had been in contact with a social worker in the last four weeks (19 April – 16 May 2021), the same as Wave 23. During periods of tighter restrictions, many local authorities reported in the open text question that they were contacting children more frequently than their plan. Over time, as restrictions were lifted, many local authorities reported they were returning to business as usual and contacting children within statutory timescales. The frequency of visits should be determined on a case by case basis; therefore it is not expected that all children should be contacted every four weeks.

Figure 2: Contact with social workers in the last four weeks

Notes:

‘W3’ refers to Wave 3 and so on.

Guidance to local authorities on the correct methodology to calculate other CIN was improved at Wave 3. Local authorities were prompted again at Wave 6. This may explain decreases in percentages for this group over time.

See Annex B for the number of local authorities that responded to the question per wave.

Analysis of the open text questions in the earlier survey waves (1-4; May – June 2020) described the local authority activities to safeguard children that they were not in contact with. These comprised of: risk assessing and RAG rating cases, working with other agencies to manage risk and working with schools to ensure that welfare checks and contact were taking place with vulnerable children not attending school.

Across subsequent survey waves (5-12; July – October 2020) many local authorities reported having further adapted their approach with more face to face contact resuming. From Wave 5, some local authorities reported activities that were focusing on hidden harms and early help to identify children who may be at risk. Some local authorities were developing new ways to manage risk and monitor contact, for example through new reporting tools, to safeguard the children that they were not in contact with.

In survey waves 13-17 (November 2020 – January 2021) local authorities reported reviewing their contact arrangements in light of the local and national restrictions introduced in November, December and January. Despite these restrictions, the majority of local authorities that responded to the open text question indicated that they were trying to continue with face to face visits as much as possible, *“there is an expectation that visits will now be face to face in person unless Covid restrictions prevent this (eg. Positive Covid test in the household, self-isolating).”* Some local authorities told us that they were also considering factors such as assessed risk, case type and the local incidence of transmission of the coronavirus (COVID-19) virus when deciding on frequency and mode of visits.

In waves 18-19 of the survey (late January – February 2021) some local authorities indicated that they are making a return to using virtual visits for some children. One local authority commented, *“the past week has seen 50% of latest contacts made virtually compared to 33% a week ago”*. Another local authority told us, *“the majority of children on child protection and child in need plans are currently being seen remotely, following risk assessments. Children under the age of 5 subject to child protection plans are being prioritised for face to face visits. Children who are looked after are being seen remotely in the majority of cases based on an updated risk assessment.”* Many local authorities went on to add that face to face visits will take place if an *“assessment shows an escalation of risk”* or if children have *“significant and complex needs”*, and that these arrangements are reviewed by managers. Some local authorities also commented on the frequency of visits. Consistent with previous waves, local authorities told us that they are risk assessing cases to determine how often visits are made.

In recent survey waves (20 - 23; February – April 2021) responses regarding the mode of visits were mixed. Some local authorities continue to tell us that they are using virtual visits for cases which they assess as not high risk. However, more local authorities than

in previous waves are reporting they are maintaining face to face contact with all cases unless there is a specific reason why they cannot e.g. if the child/family are isolating. Similar to previous waves, local authorities also told us that they are reviewing visiting arrangements. For example, *“there are some instances where the risk of COVID still requires virtual visits, but these are kept under review. In all cases where there are immediate safeguarding issues identified, face to face visits are taking place”*.

In the most recent wave of the survey (24 – May 2021) more local authorities told us face-to-face visiting is now being used as normal practice. For example, *“Its business-as-usual contacts for all children open to CSC and the majority of visits for children on plans or those that are expected to be on a plan are now face to face”* and *“we have now established a steady state of face to face visiting that is only ever interrupted when there is a known positive Covid infection in a household.”*

Children’s Social Care Workforce

Local authorities were asked about the availability of their staff during coronavirus (COVID-19); both the social worker workforce and residential care staff. A new question was added to Wave 3 of the survey which asks whether the local authority directly employs residential care staff. Note that local authorities were previously reporting 0% if they do not directly employ residential care staff. As such the sample consisted of fewer local authorities from Wave 3, and the figures from Wave 3 onwards are not directly comparable to waves 1 and 2.

The proportion of social workers unavailable to work due to coronavirus (COVID-19) has remained low; 2% of local authorities reported more than 10% of their workforce unavailable in Wave 24. This is compared to 1% in waves 22 and 23 and a peak of 13% in May 2020.

The proportion of residential care staff unavailable to work due to coronavirus (COVID-19) has decreased to the lowest levels since the survey began, with 3% of local authorities reporting over 10% of staff unavailable in Wave 24, compared to 5% in Wave 23 and a peak of 27% in June 2020. It should be noted that some local authorities have small residential care workforces and therefore a small change in staff availability may result in large changes in the proportion of staff unavailable to work due to coronavirus (COVID-19).

Figure 3. Proportion of local authorities that reported over 10% of staff not working due to coronavirus (COVID-19)

Notes:

'W1' refers to Wave 1 and so on.

The figures from Wave 3 onwards are not directly comparable to waves 1 and 2.

See Annex B for the number of local authorities that responded to the question per wave.

In the open text responses, local authorities told us in early waves of the survey (1-4; May – June 2020) that workforce availability linked to the coronavirus (COVID-19) outbreak was not as problematic as they originally expected at the outset. Some local authorities voiced concerns about the demands on frontline staff and staff isolation with the advent of staff working from home. Some local authorities provided examples where staff had been re-deployed, and training was provided on the impact of coronavirus (COVID-19) on practice.

In survey waves 12-19 (October 2020 – February 2021) some local authorities told us that they had some of their workforce that were either off sick, self-isolating or shielding. However, in the open text responses when referring to the workforce, local authorities were more likely to describe the general tiredness and stress amongst their frontline staff. In waves 20-21 (February – March 2021) workforce availability did not feature in the open text responses but some local authorities again describe fatigue amongst staff.

In recent survey waves (22 - 24, March – May 2021), no common themes about the workforce were reported in the open text response.

Referrals to Children’s Social Care services

In waves 1 and 2, local authorities were asked to report the number of referrals to children’s social care services they received in the last week. From Wave 3, local authorities were asked for the number of referrals to children’s social care services the week before last to account for the lag in reporting that affected waves 1 and 2. As such, the figures from Wave 3 onwards are not directly comparable to waves 1 and 2.

From Wave 3 onwards local authorities were also asked to report the sources of their referrals.

In Wave 24 (03 - 09 May 2021), the total number of referrals was 1% lower than a three-year average of the same week across 2017 to 2020.

The total number of referrals to children’s social care services reported in waves 1 to 24 of the survey was 243,610, this is around 10% lower than an average of the same weeks during 2017-20. It is estimated that there have been around 61,000 fewer referrals since May 2020 compared to 2017-20; this estimate takes into account local authorities that did not respond and weeks not covered by the survey.

Table 1: Number of referrals received in the survey compared to the same weeks in 2017-20

Wave	Total number of referrals	Average referrals 2017-20
W1: 27 Apr-03 May 2020	9,340	11,190
W2: 11-17 May 2020	8,960	12,750
W3: 18-24 May 2020	9,870	11,780
W4: 01-07 Jun 2020	10,670	12,470
W5: 15-21 Jun 2020	11,090	13,330
W6: 29 Jun–05 Jul 2020	11,510	13,000

Notes:

'W3' refers to Wave 3 and so on.

*Waves should be treated with caution due to the timing of school holidays from year to year.

Other sources include local authority services, legal agencies and children's centres.

See Annex B for the number of local authorities that responded to the question per wave.

The open text responses across all of the survey waves show very mixed experiences in the numbers of referrals received across local authorities. Some local authorities reported that the number of referrals had increased and were at levels higher than average, whilst others report that referrals remained lower than average or as expected at this time of year. In survey waves 18-21 (January – March 2021) the mixed experiences in the number of referrals received continued but slightly more local authorities told us that their

referral numbers have fallen just as they did back in March 2020 during the early stages of the coronavirus (COVID-19) pandemic.

In waves 20-24 (February – May 2021) we specifically asked local authorities to tell us about the type and volume of referrals anticipated when schools returned to full opening in March. Responses were mixed with some local authorities expecting a surge in referrals and some expecting referrals to increase modestly or not at all (see the ‘key themes’ section below for a fuller description of this). In Wave 23 (April 2021) we asked local authorities to tell us if they have made or are planning any changes in practice or delivery to help manage any increase in referrals. Changes mentioned included providing support earlier, working with schools to manage demand and making changes to manage staff capacity (see the ‘key themes’ section below for a fuller description of this).

Children who have started to be looked after

In waves 1 and 2, local authorities were asked to report the number of children that started to be looked after in the last week. From Wave 3 local authorities were asked for the number of looked after children starting the week before last to account for the lag in reporting that affected waves 1 and 2. As such, the figures from Wave 3 onwards are not directly comparable to waves 1 and 2.

The total number of CLA starting in 137 local authorities during Wave 24 (03 - 09 May 2021) was 370 compared to an average of 540 during the same weeks in 2017-20 (-31%). The total number of children who have started to be looked after reported in waves 1 to 24 of the survey was 9,670, this is around 29% lower than an average of the same weeks during 2017-20. It is estimated that there have been roughly 9,000 fewer LAC starting since May 2020 compared to 2017-20; this estimate takes into account local authorities that did not respond and weeks not covered by the survey. There has been a downward trend in the number of children starting to be looked after in recent years², therefore we may expect the numbers returned in this survey to be lower than the same period in 2017-20.

For the majority of local authorities there has been a difference of up to 5 children compared to the 3 year average of the same week across 2017 to 2020.

² [Children looked after in England including adoption: 2019 to 2020](#)

Figure 5: Total number of children looked after starting per week and 3-year average of the same week across 2017 to 2020

Notes:

'W1' refers to Wave 1 and so on.

The figures from Wave 3 onwards are not directly comparable to waves 1 and 2.

See Annex B for the number of local authorities that responded to the question per wave.

In the open text questions from July 2020 onwards a small but growing number of local authorities report that they continue to have higher numbers of open cases and that care proceedings are taking longer to complete. The reasons cited include the lack of direct work with families and services in support of reunifications and delays in court hearings. This means that planned permanency moves were not happening. One local authority explained “...whilst the volume of contacts and referrals has returned to expected levels there continues to be considerable pressure in the system. This is caused by the backlog of cases in court proceedings which are either progressing very slowly or are paused. This is causing additional work in those cases, but more importantly this is also showing an adverse impact on children's wellbeing. A further effect of this is the pressure on placements, which are being lengthened to match the duration of proceedings. This is reducing the availability of suitable placements for children newly coming into care, or for children who have experienced an unexpected change in their placement”.

Key themes from open question responses

These findings are derived from the open text questions in the survey. One of the questions asks about the 'steps local authorities have been taking to safeguard children that they are not in contact with' and the other asks about any 'trends, challenges and good practice'. The phrasing of this latter question was changed from Wave 9 (September 2020) when we asked local authorities to tell us about any changes in the demand for children's social care services that they are seeing. In later survey waves (from Wave 17, January 2021) in our covering email about the survey, we have asked local authorities to tell us about specific issues (e.g. current pressures and planning and expectations about referrals), these are reported below.

Not all local authorities respond to the open text questions, and those that do so provide views reflecting the unique circumstances and challenges in their area. These may not be comprehensive of all issues, nor reflective of views and practices of all local authorities. A note of caution should therefore be exercised when reading these findings.

Previous publications from the survey¹ contain some analysis of the open text questions that is not repeated here.

Working with coronavirus (COVID-19) and the future

In the early waves of the survey (1-4; May – June 2020), local authorities told us how they were adapting their working arrangements in response to the coronavirus (COVID-19) pandemic and about their recovery plans. Local authorities risk assessed and RAG rated their cases and at that time these informed the scheduling and mode of social work visits (carried out virtually and face to face where possible). To stay in touch, alternative forms of communication, for example telephone calls and WhatsApp were used and some local authorities provided children and families with new technology to enable this. Early recovery plans focused on incremental approaches to direct work, gradual reopening of offices and requests for government guidance to assist them with these.

In the following waves of the survey (5-10; July – September 2020), the working arrangements and recovery plans that local authorities described involved moving from a crisis response towards a 'business as usual - living with coronavirus (COVID-19)' approach. Local authorities were reverting to their usual assessment and planning processes, they continued to assess the required frequency of contact with cases and took a "blended" approach to visits which comprised of both virtual and face to face contact. In the later survey waves, many local authorities reported that visits were taking place face to face unless there were ongoing health concerns of staff or family. Local authorities updated their safety procedures and made adjustments to buildings and some told us about their contingency plans in preparing for an increase in demand.

In later survey waves (11-21; October 2020 – March 2021) local authorities reported reviewing and readjusting their practice depending which coronavirus (COVID-19) local

and national restrictions were in place, as discussed on page 7. Local authorities reported using the same arrangements as earlier in the pandemic to manage risk and protect children, *“The infrastructure and arrangements we put into place in April and May 2020 (including pre visit risk assessments, guidance to staff, arrangements for PPE and increased management oversight) continue to serve us well with only small adjustments required when guidance changes”*. Some local authorities also told us that they were making plans based on their experiences at the start of the coronavirus (COVID-19) pandemic, *“the planning is in place for the forecasted increase in demand at the end of the lockdown and when the schools are back to normal. The impact seen in the first lockdown is being used as a predicting model for the impact of the third lockdown”*.

In survey waves 20-22 (February – March 2021) local authorities reported themes consistent with previous waves. In response to us asking, some local authorities also told us how they are planning and preparing for a possible increase in referrals when the schools fully re-open. In Wave 23 and 24 (April – May 2021) some local authorities described the changes in practice that they have made or are planning to help manage any increase in referrals (see the ‘expectations and planning for referrals’ section below for a fuller description of this).

Working with schools and other safeguarding partners

Across all survey waves, local authorities provide examples of joint working between local authorities, schools and other safeguarding partners on issues associated with the pandemic (see earlier publications for examples). Over the summer, local authorities carried out activities to encourage attendance in preparation for schools returning to full capacity and some told us that they provided specific support (for example holiday activity programmes and provision of food parcels) to vulnerable children during this time. In later survey waves (9-19; September 2020 – February 2021), local authorities resumed their close working with schools to track the attendance of vulnerable children and children isolating due to coronavirus (COVID-19) outbreaks. Responses to the open text questions suggest that processes for sharing information with schools became more embedded over time. Some local authorities told us that they monitored which children had been seen at school and this helped inform decisions around social work contact and support. For example, *“we know from education partners which children have additional vulnerabilities, including whether they are engaged in education, and are taking a risk managed approach to support those families who need it”* and *“we continue to work closely with schools in identifying vulnerable children who are not in school to clarify reasons and ensure any safeguarding concerns are appropriately addressed”*.

In the most recent waves of the survey (20-24; February – May 2021) some local authorities told us that they were continuing to work closely with schools to monitor attendance and to ensure schools receive the support they need if there is an increase in safeguarding needs. For example, one local authority told us *“the number of contacts required between school and social workers where pupils are absent for any reason*

remains comparatively low. We have established a system to follow up on non-attendance of pupils with a social worker, including following up with schools themselves". Some local authorities also mentioned working closely with virtual school heads in their responses, "we are working closely with other agencies to promote school attendance. Virtual school heads are tracking and facilitating communication with school/social workers."

Case Complexity

Across all the survey waves local authorities described the types of cases that they are seeing. A common and consistent theme has been an increase in cases involving suspected domestic abuse. In later survey waves (9-24; September 2020 - May 2021) a growing number of local authorities also described an increase in the complexity of the cases that they are seeing.

The examples of increased case complexity cited in the open text responses vary but include cases involving: elevated mental health issues amongst parents and children, neglect and emotional abuse, parental issues relating to alcohol and mental health, cases involving non-accidental injury, increases in the number of new-born children that are being presented in care proceedings, increases in cases involving young people self-harming, referrals where the family are in acute crisis and escalations of risks in cases that are already open to children's social care. Some local authorities told us that case complexity is evidenced through the increase in the contact to referral and referral to assessment conversation rate that they are experiencing.

Local authorities described how the presenting issues and case complexity are related to the pressures arising from the coronavirus (COVID-19) pandemic. The following example (from Wave 17, January 2021) exemplifies the challenges that local authorities continue to face: *"the referrals that we are receiving do appear to be a crisis point for example: lack of face to face interventions and support from other services; an increase in demand on Substance/DV/MH services which has led to longer wait times for services; children not being in school/having periods of self-isolation and demands on parents; financial pressures due to parents losing their jobs or being furlough; families general anxieties about COVID and restrictions on family support which have led to crisis. There appears to have been an increase in young people on the edge of care with parents appearing to not be able to manage and situations reaching crisis which again could be due to impact of COVID"*.

Placement Sufficiency

When we issued Wave 17 of the survey (early January 2021) in our covering email about the survey we asked local authorities to tell us in their open text responses about any current pressures related to the coronavirus (COVID-19) pandemic (e.g placement capacity, working with partners etc). Some local authorities told us that they are experiencing some placement sufficiency issues. For example, finding placements for

children with more complex needs and behaviours. Please refer to earlier versions of this publication where the open text responses about placement sufficiency are described in more detail.

Expectations and Planning for Referrals

In waves 20 and 21 of the survey (February – March 2021), in our covering email about the survey we asked local authorities to tell us about their **expectations and planning for referrals when schools reopened fully**. Responses were mixed with some local authorities expecting a surge in referrals and some expecting referrals to increase modestly or not at all. The local authorities that were not anticipating an uptake in referrals when schools reopened fully said that their referral numbers had maintained at the usual levels across the coronavirus (COVID-19) pandemic and they were not expecting to see an increase. The local authorities that were anticipating an uptake in referrals told us about their plans and mitigating activities in preparation for this. Most of the responses described how they were increasing staff capacity. Some local authorities told us that that they were working with partners and schools to ensure there were resources to support families and the provision of earlier support to families was mentioned by some local authorities. In waves 20 and 21, some local authorities were anticipating that the uptake in referrals and demand would not happen immediately. Some local authorities were also anticipating that any uptake in referrals and demand would be short lived.

In Wave 22 of the survey (March 2021) in our covering email about the survey we asked local authorities to tell us about the **referrals received after schools reopened fully and expectations about referrals over the coming weeks**. Responses were mixed. Some local authorities reported an increase in referrals whilst others told us that referrals remained at or below normal levels. Local authorities told us that they would continue to closely monitor referrals over the coming months. Similar to earlier survey waves, some local authorities were expecting referral rates to stay the same, saying that throughout the coronavirus (COVID-19) pandemic their rates had maintained at the usual levels or that they did not experience any increase in referrals following the previous re-opening of schools. Among local authorities that reported an increase in referrals during Wave 22, from the open text responses provided, local authorities appeared able to manage this demand. As in Waves 20 and 21, some local authorities told us that any anticipated uptake in referrals and demand would not happen immediately.

In our covering email for Wave 23 of the survey (April 2021) we asked local authorities to tell us if they have **made or are planning any changes in practice or delivery to help manage any increase in referrals**. The responses can be categorised into three broad themes (as at Wave 20 and 21): providing support earlier, working with schools to manage demand and making changes to manage staff capacity. The same themes were also reported by some respondents in Wave 24 (May 2021). The following quotes exemplify each of these.

Examples of **support being provided earlier**:

- *“We have not experienced any significant changes in relation to referrals since the 8th March 2021. Towards the autumn of 2020 we introduced an early help hub at our front door which has helped us to safely reduce the numbers of referrals over the last few months”.*
- *“... During the Pandemic we have brought in a Brief Intervention Team at the front door as a part of strengthening the support to families early. They are supporting social workers during the period of assessments being undertaken to offer interventions in a more timely way”.*

Examples of local authorities **working with schools**:

- *“The [LA name] Social Work in School Project will mean that the LA is well placed to meet any increase in demand”.*
- *“...we have developed strong links with school and early help through our link workers to provide support and guidance to schools and support early intervention”.*

Examples of **additional staff capacity** in local authorities:

- *“We have additional SW capacity in CADS (the Children’s Advice and Duty Service) than we had in June 2020. Our staffing levels have been enhanced and we now have 4 SW & 2 Practice Managers based permanently in CADS. We therefore have resilience which has been needed to cope with the increase in contacts during March 2021, as stated, it feels that our cohort of CADS social work staff is at the correct level for our borough now”.*

In addition, in this wave, some local authorities, described the **types of cases expected** over the coming months. One local authority told us that they are expecting *“more contacts requesting support with debt management, parental substance misuse, child behaviours and child mental health, contacts regarding homelessness and eviction”.* Another local authority said they have *“seen increases in reports of sexual abuse including historical reports, current disclosures, online grooming and accessing indecent images and peer on peer sexually harmful behaviours and reports of significant neglect for children where professionals have not been able to access during the last year”.*

Some local authorities also described their **support services** to deal with the types of issues that they are seeing. For example, one local authority said *“we are developing our domestic abuse toolkit to support all practitioners working with families around managing domestic abuse and have launched a new perpetrator programme... We are implementing our contextual safeguarding approach and toolkit across our partnership to work with our communities around extra familial harm, this is being led by our targeted youth workers”.*

Pressures on the care system

In our covering email for Wave 24 of the survey (May 2021) we asked local authorities to tell us about **pressures on the care system – their experience of both new entrants to care and care leavers – and if they have made or are planning to make any changes in practice or delivery to help manage these pressures**. Local authorities interpreted the question in different ways, some described their care numbers across the entirety of the pandemic, whilst some talked about care numbers in more recent months.

Responses provided were very mixed. A slightly higher proportion of local authorities said that care numbers had increased across the pandemic and/or in more recent months. Others told us that their care numbers remain consistent with some describing how existing pressures in the care system have continued (e.g. that existed pre-pandemic). A sizeable proportion of local authorities told us that their care numbers have reduced and told us about the introduction of work that enabled this.

Examples of local authorities that have seen their **care numbers increase**:

- *“We are experiencing a small increase in children becoming CLA due to Covid - this is due to the increased pressure on families to manage the anxiety and uncertainty, a lack of face to face work from partner agencies and a higher need for intensive support to families which is impacting on our ability to support children to remain with their families. This is in turn impacting on the sufficiency of placements, particularly suitable foster placements for children.*
- *”...The rise in the number of looked after children can in part be attributed to the Covid pandemic, ...3 periods of lockdown will have created increased pressures upon households and additional parental stress and mental health issues... There have also been a number of children, in particular the under 2 year olds, that have been considered to be significantly adversely affected by the pandemic and been at significant risk of physical harm which has led to emergency orders having been secured in relation to them... During the same period, there has been a decrease in the numbers of children that have left care. There have been delays experienced in the courts in achieving permanence through adoption and special guardianships for children.”*

Examples of local authorities that have **not seen significant changes in their care numbers**:

- *“We haven't seen a significant shift from last year to this year despite the pandemic. We continue to have a challenge around sufficiency for children with complex needs but numbers are fairly stable.”*
- *“Sufficiency pressures, created by a reduced number of care exits from April 2020, have now eased, with a return to the pre-Covid level of children in care. However, those pressures remain in the wider system, and as such could still impact on us.*

Court delays in a quarter of all cases, currently in proceedings, are impacting on timeliness of adoption work”.

Examples of local authorities that have seen their **care numbers reduce** with examples of work that has enabled this:

- *“The numbers of children in our care in [LA name] have been on a steady downward trajectory during the pandemic. This, to some extent, has been as a result of our legal gateway panel ensuring that those most worrying children have all the support and resources in place at child protection level to have the greatest impact.”*
- *“We have managed the numbers of children in care well over the last 14 months with no significant rise - this is as a result, in part, of us having a 'Placement Solutions Team' who complement the work of social workers to develop positive exit plans...”*
- *“Our numbers of children in care are now below pre-pandemic figures... the lowest they have been for over four years... The reduction, we attribute to improvements in our ways of working based on our systemic practice model. Specifically, we have continued to make improvements to our approach to pre-proceedings processes, discharge from care processes and special guardianship orders. We are continuing to innovate in our edge of care and care systems, which we expect will reduce our children in care numbers further and strengthen our internal provision.”*

Annex A: survey questions and time periods

The questions asked in the survey are shown below. All local authorities were asked to complete the form.

Question 1

How many children do you have in the following groups?

- a) Children looked after, children on a protection plan and other children in need
- b) Children looked after, children on a protection plan and other children in need that have been seen or contacted by their social worker in the last 4 weeks
- c) What steps are you taking to safeguard those children that you are not in contact with?

Question 2

How many of the following staff are employed by your local authority and approximately what proportion of them are not working at the moment due to coronavirus (COVID-19) (FTE)? Choose from: 0-10%, 11-20%, 21%-30%, 31-40%, 41-50%, 51-60%, 61-70%, 71-80%, 81-90%, 91-100%.

- a) Social workers - permanent or agency
- b) Residential care staff

Question 3

How many referrals to children's social care services you received in the week before last?

Question 4

Please tell us about the source of referrals received in the week before last:

- a) Individual
- b) Schools
- c) Health services
- d) Police
- e) Other

Question 5

How many children started to be looked-after in the week before last?

Question 6

Can you please tell us if you are seeing any changes in the demand for children's social care services (e.g. increases in referrals, changes in case complexity or the profile of children being supported) and the impact of these changes.

Question 7

Use this space if you would like to tell us how you have calculated any of these data items and any assumptions that you have made.

Table A1: Time periods referred to in questions

Wave	Questions referring to collection dates	Questions referring to last 4 weeks	Questions referring to last week	Questions referring to week before last
Wave 1	04- 06 May 2020	-	27 April - 03 May 2020	-
