How can I use this document?

This document is a subject benchmark statement for Earth sciences, environmental sciences and environmental studies that defines what can be expected of a graduate in the subject, in terms of what they might know, do and understand at the end of their studies.

You may want to read this document if you are:

- involved in the design, delivery and review of programmes of study in Earth sciences, environmental sciences and environmental studies or related subjects
- a prospective student thinking about studying Earth sciences, environmental sciences and environmental studies, or a current student of the subject, to find out what may be involved
- an employer, to find out about the knowledge and skills generally expected of a graduate in Earth sciences, environmental sciences and environmental studies.

Explanations of unfamiliar terms used in this subject benchmark statement can be found in the Quality Assurance Agency for Higher Education's (QAA's) glossary.¹ QAA has also published a general guide to quality assurance in higher education.²

¹ The QAA glossary, available at: www.qaa.ac.uk/aboutus/glossary.

² A general guide to quality assurance, available at: www.qaa.ac.uk/AssuringStandardsAndQuality/what-is-quality.

About subject benchmark statements

Subject benchmark statements form part of the UK Quality Code for Higher Education (Quality Code) which sets out the Expectations that all providers of UK higher education reviewed by QAA are required to meet.³ They are a component of *Part A: Setting and maintaining academic standards*, which includes the Expectation that higher education providers 'consider and take account of relevant subject benchmark statements' in order to secure threshold academic standards.⁴

Subject benchmark statements describe the nature of study and the academic standards expected of graduates in specific subject areas, and in respect of particular qualifications. They provide a picture of what graduates in a particular subject might reasonably be expected to know, do and understand at the end of their programme of study.

Subject benchmark statements are used as reference points in the design, delivery and review of academic programmes. They provide general guidance for articulating the learning outcomes associated with the programme but are not intended to represent a national curriculum in a subject or to prescribe set approaches to teaching, learning or assessment. Instead, they allow for flexibility and innovation in programme design within a framework agreed by the subject community. Further guidance about programme design, development and approval, learning and teaching, assessment of students, and programme monitoring and review is available in *Part B: Assuring and enhancing academic quality* of the Quality Code in the following Chapters:⁵

- *Chapter B1: Programme design, development and approval*
- *Chapter B3: Learning and teaching*
- *Chapter B6: Assessment of students and the recognition of prior learning*
- *Chapter B8: Programme monitoring and review.*

For some subject areas, higher education providers may need to consider other reference points in addition to the subject benchmark statement in designing, delivering and reviewing programmes. These may include requirements set out by professional, statutory and regulatory bodies, national occupational standards and industry or employer expectations. In such cases, the subject benchmark statement may provide additional guidance around academic standards not covered by these requirements.⁶ The relationship between academic and professional or regulatory requirements is made clear within individual statements, but it is the responsibility of individual higher education providers to decide how they use this information. The responsibility for academic standards remains with the higher education provider who awards the degree.

Subject benchmark statements are written and maintained by subject specialists drawn from and acting on behalf of the subject community. The process is facilitated by QAA. In order to ensure the continuing currency of subject benchmark statements, QAA initiates regular reviews of their content, five years after first publication, and every seven years subsequently.

³The Quality Code, available at: www.qaa.ac.uk/qualitycode, aligns with the *Standards and Guidelines for Quality Assurance in the European Higher Education Area*, available at: www.enqa.eu/index.php/home/esg.

⁴*Part A: Setting and maintaining academic standards*, available at: www.qaa.ac.uk/Publications/InformationAndGuidance/Pages/Quality-Code-Part-A.aspx.

⁵ Individual Chapters, available at: www.qaa.ac.uk/AssuringStandardsAndQuality/quality-code/Pages/Quality-Code-Part-B.aspx.

⁶ See further Quality Code, *Part A: Setting and maintaining academic standards*, available at: www.qaa.ac.uk/Publications/InformationAndGuidance/Pages/Quality-Code-Part-A.aspx.

Relationship to legislation

Higher education providers are responsible for meeting the requirements of legislation and any other regulatory requirements placed upon them, for example, by funding bodies. The Quality Code does not interpret legislation nor does it incorporate statutory or regulatory requirements. Sources of information about other requirements and examples of guidance and good practice are signposted within the subject benchmark statement where appropriate. Higher education providers are responsible for how they use these resources.⁷

Equality and diversity

The Quality Code embeds consideration of equality and diversity matters throughout. Promoting equality involves treating everyone with equal dignity and worth, while also raising aspirations and supporting achievement for people with diverse requirements, entitlements and backgrounds. An inclusive environment for learning anticipates the varied requirements of learners, and aims to ensure that all students have equal access to educational opportunities. Higher education providers, staff and students all have a role in, and responsibility for, promoting equality.

Equality of opportunity involves enabling access for people who have differing individual requirements as well as eliminating arbitrary and unnecessary barriers to learning. In addition, disabled students and non-disabled students are offered learning opportunities that are equally accessible to them, by means of inclusive design wherever possible and by means of reasonable individual adjustments wherever necessary.

⁷ See further the *UK Quality Code for Higher Education: General Introduction*, available at: www.qaa.ac.uk/Publications/InformationAndGuidance/Pages/Quality-Code-introduction.aspx.

About this subject benchmark statement

This subject benchmark statement refers to bachelor's degrees with honours in Earth sciences, environmental sciences and environmental studies.⁸

This version of the statement forms its third edition, following initial publication in 2000 and review and revision in 2007.⁹

Note on alignment with higher education sector coding systems

Programmes of study which use this subject benchmark statement as a reference point are generally classified under the following codes in the Joint Academic Coding System (JACS): C100 C110 C131 C141 C142 C150 C160 C161 C162 C180 C181 C182 C183 C184 C185 C186 C187 C190 C200 C210 C260 C290 C340 C360 C410 C470 C500 C510 C530 C590 C790 D411 D443 D446 D447 D448 D470D472 D514 D540 D541 D711 D720 F110 F140 F330 F331 F510F522 F600 F610 F640 F642 F644 F700 F733 F734 F750 F751 F753 F754 F755 F756 F762 F764 F770 F790 F800 F810 F840 F842.¹⁰

Summary of changes from the previous subject benchmark statement (2007)

This benchmark statement covers a wide range of subject areas within three distinct but overlapping subjects. Following requests for information from over 20 professional, statutory and regulatory bodies (PSRBs), a revised draft document was circulated to higher education providers in 2014. The current version of the benchmark statement for Earth sciences, environmental sciences and environmental studies clarifies the distinctiveness between the three major subjects while identifying generic skills and including developments in the subject areas since the 2007 version. Such changes include a greater emphasis on:

- sustainability and sustainable development
- employability and professionalism (including links to PSRBs)
- multidisciplinary and interdisciplinarity
- the importance of practical skill development, especially in field situations.

⁸ Bachelor's degrees are at level 6 in *The framework for higher education qualifications in England, Wales and Northern Ireland* (2008) and level 10 in the *Scottish Credit and Qualifications Framework* (2001).

⁹ Further information is available in the *Recognition scheme for subject benchmark statements*, available at: www.qaa.ac.uk/Publications/InformationAndGuidance/Pages/Recognition-scheme-for-subject-benchmark-statements.aspx.

¹⁰ Further information about JACS, available at: www.hesa.ac.uk/content/view/1776/649.

1 Introduction

1.1 Throughout this subject benchmark statement, Earth sciences, environmental sciences and environmental studies are referred to collectively as ES3. The three subject areas are also referred to individually where appropriate.

1.2 The review group recognises that the subject benchmark statement covers a wide range of subjects. While each could be seen as a distinct area in its own right, it is clear that there is sufficient overlap between the subjects that a single benchmark statement is appropriate. This applies particularly to generic skills and the graduate knowledge components of the three subject areas.

1.3 ES3 is characterised by the following common features:

- a focus on understanding Earth systems in order to learn from the past, understand the present and influence the future
- an emphasis on practical (especially field-based) investigation
- multidisciplinary and interdisciplinary approaches
- working across a range of spatial and temporal scales
- the development of skills in observation and analysis to support decision making in the light of uncertainty
- an appreciation of societal contribution and context
- the development of professional skills for employability.

1.4 There are a range of PSRBs that cover the range of subjects in ES3. Some of these offer accreditation for courses, higher education programmes and a variety of membership opportunities, including chartered status for individuals. Notable organisations include the Geological Society of London, the Institution of Environmental Sciences, the Chartered Institute of Ecology and Environmental Management, and the Institute of Environmental Management and Assessment. Many others cover more specialist aspects such as air quality, water quality, or subjects allied to ES3 but linked to other subjects, such as engineering, agriculture, and so on.

1.5 Sustainability is a fundamental part of many subject areas associated with ES3 and is built into most curricula. This aspect of ES3 may also influence curricula in other subject areas, as the emphasis grows on the importance of providing all graduates with the necessary skills to promote a sustainable society. Sector agencies are working together to produce guidance for higher education providers in implementing education for sustainable development across subject areas.

1.6 Although this benchmark statement covers the subjects as delivered at bachelor's degree with honours level (usually BSc or sometimes BA), there are a number of other award levels from this guidance. Foundation degrees (FdSc) may provide a pathway towards an honours degree and hence the skills and knowledge base (including the emphasis on appropriate professional and practical skills) given here may be useful for those developing foundation degree curricula. In addition, there are a number of integrated master's programmes (such as MEnv) which integrate BSc and master's level work culminating in an award. While this benchmark statement is focused on the skills and knowledge gained by students completing an honours degree, it is also relevant in the design of integrated master's programmes.

2 Subject coverage and knowledge

2.1 The ES3 heading (and even each component subject) can encompass a very wide diversity of programmes and award titles. The benchmarking group (2000) identified the following important shared features:

- tuition based on holistic, multidisciplinary and interdisciplinary approaches
- the integration of fieldwork, experimental and theoretical investigations underpinning the learning experience, especially in Earth and environmental sciences (although this can also be important in environmental studies)
- quantitative and qualitative approaches to acquiring and interpreting data
- examination of the exploration for, and exploitation of, physical and biological resources
- examination of the implications of sustainability and sustainable development.

2.2 The first review group (2007) made relatively minor amendments to the original benchmark statement to focus on shifting values within the area, including greater emphasis on:

- sustainability with particular emphasis on the environmental context of sustainability
- employability
- the links to and roles of professional bodies
- interdisciplinarity and problem solving
- provision of content statements to accompany performance levels
- clarity on the terrain encompassed by programmes in Earth sciences, environmental sciences and environmental studies.

2.3 ES3 is so broad that it inevitably overlaps with other subjects, and higher education providers may also use other relevant subject benchmark statements. Specialist subjects such as oceanography, meteorology and soil science that fall within many ES3 courses form degree programmes in their own right.

Subject knowledge for degree programmes broadly concerned with Earth sciences

2.4 Each honours degree has its own characteristics, underpinned by a detailed rationale for its content, nature and organisation. While it is recognised that programmes will vary considerably in the depth and specificity to which they treat subjects, it is anticipated that all graduates will have appropriate knowledge of the main aspects of the Earth sciences, as listed.

- A holistic view of the present and past interactions between components of the Earth system, including the effects of extraterrestrial influences on these interactions.
- The cycling of matter and the flows of energy into, between and within the solid Earth, the Earth's surface, the hydrosphere, the atmosphere and the biosphere.
- The study of the biological, chemical and physical processes that underpin our understanding of the structure, materials and processes relevant to the Earth and planetary bodies.
- The central paradigms in the Earth sciences: uniformitarianism (the present is the key to the past); the extent of geological time; evolution (the history of life on Earth); and plate tectonics.

- Geological time, including the principles of stratigraphy, the stratigraphic column, the methods of geochronology, the rates of Earth processes, major events in Earth history, the evolution of life as revealed by the fossil record, the quaternary and anthropocene.
- Collection and analysis of Earth science data in the field, and the appropriate presentation, manipulation and extrapolation of these sometimes incomplete data in both two and three-dimensions, including the generation of geological maps and cross sections.
- The study of structures, materials and processes that includes an appreciation of temporal and spatial variations at appropriate scales.
- The study of the structure, the composition and the materials of the solid Earth (core, mantle, crust, asthenosphere, lithosphere and so on), the hydrosphere, the atmosphere, the cryosphere and the biosphere, and the processes operating within and between them.
- An understanding of other planetary bodies.
- Earth science terminology, nomenclature and classification of rocks, minerals, fossils, and geological structures.
- The identification of rocks, minerals, fossils, and geological structures.
- Surveying and measurement both in the field and laboratory, and using quantitative and instrumental techniques.
- An awareness that the understanding and knowledge gained from the subject and its application has to be considered within a wider socio-economic and environmental context. This may include:
 - the exploration for and development of Earth resources (for example, hydrocarbons, minerals, water, carbon dioxide sequestration, aggregates and radioactive waste)
 - the use of past climates to understand climate change
 - geological aspects of human impact on the environment
 - geohazards (for example, flooding, earthquakes, volcanic eruptions and landslides) and their impact on society and the environment
 - an Earth science perspective on sustainability, environmental impact and social awareness.

2.5 Typical elements may include:

- engineering geology
- geochemistry
- geological mapping
- geomorphology
- geophysics
- geographic information systems and remote sensing applications
- hydrogeology
- igneous and metamorphic petrology
- local and global tectonics
- mineralogy
- mineral deposits
- natural hazards
- palaeobiology
- palaeoclimatology
- palaeontology
- petroleum geology
- petrology
- sedimentology

- stratigraphy
- structural geology.

2.6 Applications of the subject areas might include:

- the exploration, development and remediation/storage of Earth resources (for example, hydrocarbons, minerals, water, carbon dioxide sequestration, aggregates and radioactive waste)
- past climates to understand climate change and the impact on the environment and society
- civil engineering (for example, land restoration, site investigations and waste disposal)
- geohazards (for example, flooding, earthquakes, volcanic eruptions and landslides).

Subject knowledge for degree programmes broadly concerned with environmental science

2.7 Each honours degree has its own characteristics, underpinned by a detailed rationale for its content, nature and organisation. While it is recognised that programmes will vary considerably in the depth and specificity to which they treat subjects, it is anticipated that all graduates will have appropriate knowledge of the main aspects of the environmental sciences, as listed.

- A systems approach to study of the complexity and interconnections of the Earth's systems and processes.
- The scientific study of physical, chemical, biological and anthropogenic processes operating on the ecosystems.
- Major environmental processes on scales from global to organismal, and where appropriate, to the molecular and atomic levels of organisation.
- The importance of timescale, from geological to the short term, on the impacts of natural and human-induced activities on the ecosystem.
- The spatial scale, from global to local, of human impacts on the environment and responses to environmental change.
- The nature, organisation, complexity, sustainability and interconnections of humans and the ecosystems.
- A scientific and interdisciplinary approach to identify, understand and manage the Earth's processes and the ecosystem.
- The principles of energy consumption, resource extraction and waste disposal arising from the fulfilment of human needs.
- Monitor, model and manage natural and human-induced environmental changes and behaviour.
- The principles of sustainability and the use of sustainable approach to manage the natural cycles.
- Key concepts of environmental instruments, for example, environmental impact assessment, management and policy; risk-based management; environmental engineering approach; sustainability and sustainable development; and precautionary principles.
- The role of institutions, organisations and other stakeholders in managing and regulating the human impact on the environment.
- The role of environmental and sustainability professions in contributing to policy and practice, influencing behaviour and delivering positive change to environmental performance.

- Risks presented by a changing environment.
- The use of scientific and technological information and tools to inform decision-making processes and environmental management.
- A holistic approach to resolve a broad spectrum of environmental issues and enhance environmental performance.
- The options for remediation of environmental impacts available to human society.

2.8 Typical elements may include:

- air, land and water pollution
- approaches to, and limitations of, environmental management systems
- biodiversity
- biogeochemical cycles
- business and the environment
- climate change
- conservation
- demand for, and consequences of, energy production and use
- demand for, and consequences of, water resource utilisation
- ecology
- ecosystem
- ecological processes
- energy sources
- environmental auditing
- environmental decision making
- environmental economics
- environmental engineering
- environmental ethics
- environmental impact assessment
- environmental legislation and regulations
- environmental limits to economic or population growth
- environmental management
- environmental modelling
- environmental monitoring
- environmental pollution control
- environmental performance
- environmental precautionary principles
- food and water supply, demand and scarcity
- geographic information systems
- global conventions and treaties
- green industry
- human adaptation to climate change
- life cycle analysis
- population growth and dynamics
- principle hazards
- resource management
- risk assessment and management
- role of institutions in regulation and management of the environment
- social equity and social justice
- stakeholders in environmental decision making
- sustainability and sustainable development
- valuation of the environment.

Subject knowledge for degree programmes broadly concerned with environmental studies

2.9 Each honours degree has its own characteristics, underpinned by a detailed rationale for its content, nature and organisation. While it is recognised that programmes will vary considerably in the depth and specificity to which they treat subjects, it is anticipated that all graduates will have appropriate knowledge of the main aspects of environmental studies, as listed.

- A systems approach to study of the complexity and interconnections of the Earth's systems and processes.
- The cycling of matter and the flows of energy into and within the Earth's systems and their role in supporting life.
- The nature, organisation, complexity, sustainability and interconnections of human systems.
- The history and current evidence of natural and human-induced environmental change.
- The consequences for the environment of energy consumption, resource extraction and waste disposal arising from the fulfilment of human needs.
- The sociological, political and economic implications of human interactions with the environment.
- The relationship between the environment and human cultures and values.
- The use of scientific and technological information to inform decision-making processes and environmental management.
- The options for remediation of environmental impacts available to human society.
- The role of institutions, organisations and other stakeholders in managing and regulating human interaction with the environment.
- The concepts and applications of sustainability and sustainable development.
- The importance of timescale, from geological to the short term, in considering the environmental impact of human activity.
- The spatial scale, from global to local, of human impacts on the environment and responses to environmental change.
- Interdisciplinary/multidisciplinary context: the contribution of the natural sciences, social sciences, technology, philosophy and ethics to the identification, understanding and, where appropriate, resolution of environmental issues and concerns.

2.10 Typical elements may include:

- biodiversity
- biogeochemical cycles
- ecology
- conservation
- food supply, demand and scarcity
- population growth
- environmental limits to economic or population growth
- demand for, and consequences of, water resource utilisation
- energy sources
- demand for, and consequences of, energy production and use
- resource management
- air, land and water pollution
- climate change
- human adaptation to climate change

- global conventions and treaties
- environmental policy formulation
- stakeholders in environmental decision making
- sustainability and sustainable development
- environmental management
- approaches to, and limitations of, environmental management systems
- role of institutions in regulation and management of the environment
- conflict and cooperation in environmental decision making
- environmental impact assessment
- environmental auditing
- environmental monitoring
- environmental hazards
- precautionary principle
- valuation of the environment
- environmental economics
- environmental ethics
- environmental legislation and regulations
- business and the environment
- social equity and social justice.

3 Generic skills

3.1 The generic skills are applicable to all degree programmes in ES3. However, each higher education provider decides on the exact content and emphases of their degree programme(s) and their constituent parts.

3.2 The point at which the generic skills are introduced and the level of engagement by students is to be decided by those responsible for developing individual curricula.

3.3 Threshold levels of performance are indicated for each of the skills. These describe what a student should be able to achieve on completion of an honours degree in ES3, measured through appropriate assessment strategies. Although it is recognised that not all learning outcomes can be objectively assessed, it is important to emphasise that levels of performance above the threshold are established in terms of the shared values of the academic community as moderated internally and externally by academic quality procedures.

Intellectual skills

- Knowledge and understanding of subject-specific theories, paradigms, concepts and principles.
- Ability to integrate evidence from a range of sources to test findings and hypotheses.
- Ability to consider issues from a range of interdisciplinary and multidisciplinary perspectives.
- Ability to analyse, synthesise, summarise and critically evaluate information.
- Ability to define complex problems and to develop and evaluate possible solutions.
- Display a critical approach to, and ability to reference, academic literature, data and other sources of information.

Practical skills

- Conduct fieldwork and laboratory investigations competently.
- Ability to describe and record observations in the field and laboratory.
- Ability to interpret and evaluate practical results in a logical manner.
- Ability to undertake laboratory and fieldwork ethically and safely.
- Ability to plan, conduct and present an independent project with appropriate guidance.
- Ability to prepare, manipulate and interpret often incomplete data using appropriate techniques.
- Ability to use appropriate numerical and statistical techniques.
- Ability to use appropriate technologies in addressing problems effectively.

Communication skills

- Ability to communicate effectively to a variety of audiences using a range of formats.
- Display good interpersonal communication skills to enable effective team working.
- Ability to argue a case in an effective manner.

Personal and professional skills

- Ability to work effectively as a team member.
- Display the ability to recognise and respect the views of others.

- Display an awareness of the importance of risk assessment and relevant legislation.
- Ability to develop the skills for autonomous learning.
- Ability to identify and work towards targets for personal, career and academic development.
- Ability to reflect on the process of learning and to evaluate personal strengths and weaknesses.
- Display an appreciation of developing their graduate skills relevant to career pathways.

4 Teaching, learning and assessment

4.1 Although it is not appropriate to be prescriptive about which teaching, learning or assessment methods should be used by a particular programme, staff involved in programme delivery should be able to justify their choices of methods in terms of the learning outcomes. Such methods are to be explicit to students taking the programme concerned.

4.2 Teaching, learning and assessment are interlinked as part of the curriculum design process and are appropriate to develop the knowledge and skills identified in sections 2 and 3. Research and scholarship informs the curriculum design of all ES3 programmes. Research-led and enquiry-based programmes may develop specific subject-based knowledge and skills.

4.3 It is impossible for students to develop a satisfactory understanding of ES3 without significant exposure to field-based learning and teaching, and the related assessment. The integration of fieldwork with other learning methods is core to achieving skills: such as the ability to visualise and extrapolate data in three dimensions or understanding the application of practical methodologies. Much of the advancement in knowledge and understanding in these subject areas is founded on accurate observation and recording in the field. Developing field-related practical and research skills is therefore essential for students wishing to pursue careers in ES3. Field-based studies allow students to develop and enhance many of the generic skills (for example, team working, problem solving, self-management and interpersonal relationships) which are of value to the world of work and active citizenship.

Appendix A: Membership of the benchmarking and review groups for the subject benchmark statement for Earth sciences, environmental sciences and environmental studies

Membership of the review group for the subject benchmark statement for Earth sciences, environmental sciences and environmental studies (2014)

Pam Furniss	The Open University
Dr Douglas Paton	University of Leeds
Dr Diane Purchase	Middlesex University
Professor Hugh Rollinson	University of Derby
Professor Phil Wheeler (Chair)	Manchester Metropolitan University
	Committee of Heads of Environmental Sciences
	HEA Discipline Lead
Dr Anne Wheeler	Student reviewer
Elliot Loveless	

Membership of the review group for the subject benchmark statement for Earth sciences, environmental sciences and environmental studies (2007)

Details provided below are as published in the second edition of the subject benchmark statement.

Dr J Andrews	University of Southampton
Mrs JR Blumhof	University of Hertfordshire
Professor DA Eastwood	University of Ulster
Professor JWS Longhurst (Chair)	University of the West of England, Bristol
Professor A Rankin	Kingston University
Ms CR Roberts	University of Gloucestershire
Dr DN Thomas	Kingston University
Mr Philip Holmes (Administrative support)	Institution of Environmental Sciences

Membership of the original benchmarking group for Earth sciences, environmental sciences and environmental studies (2000)

Details provided below are as published in the original subject benchmark statement.

Mrs JR Blumhof	University of Hertfordshire
Dr CJR Braithwaite	University of Glasgow
Dr PJ Carey	University of Greenwich
Professor H Colley	Oxford Brookes University
Professor SA Dalton	Manchester Metropolitan University
Professor DA Eastwood	University of Ulster
Dr A Grant	University of East Anglia
Professor SJ Hill	University of Plymouth

Professor JWS Longhurst
Dr DAC Manning
Professor C McCann
Ms CR Roberts
Professor S Sparks
Dr DN Thomas
Professor RCL Wilson
Dr N Woodcock
Dr Helen King (Secretary)

University of the West of England, Bristol
University of Manchester
University of Reading
Cheltenham and Gloucester College
University of Bristol
Kingston University
