Chapter 1

INTRODUCTION

1. The 2007 teachers' workloads survey provides independently-collected data on the hours and working patterns of the 2,151 randomly-selected teachers in primary, secondary and special schools in England and Wales who returned useable questionnaires. It is the eighth survey to examine teachers' workloads; the previous surveys were carried out in 1994, 1996, 2000, and annually from 2003.

Background

2. Evidence previously gathered by the School Teachers' Review Body (STRB), from teacher associations and other parties as well as directly from teachers during school visits, showed mounting concern among the profession about teacher workload and its effect on morale. This concern reflected the results of three previous workload surveys commissioned by the Review Body, which showed clear increases in average teacher workload between 1994 and 2000.

3. Against this background, the STRB's Tenth Report, published in February 2001, recommended that the Department for Education and Employment (as it then was) organise an independent programme to look at the workload of teachers, and the factors contributing to it. The Department subsequently commissioned PricewaterhouseCoopers (PwC) to undertake such a study and formed a Steering Group comprising representatives of all main stakeholders to oversee and guide PwC's work.

4. After PwC's final report, in December 2001, the then Secretary of State remitted the STRB to consider teacher workload and conditions of service in some detail, and established a concurrent working party on the remodelling of teaching, with a membership similar to the earlier Steering Group. The STRB produced recommendations in May 2002 in its *Special review of approaches to reducing teacher workload*.

5. After a consultation period and further discussions within the working party, most of the organisations represented on that group signed up to a national agreement, *Raising standards and tackling workload*, in January 2003. The agreement acknowledged the pressure on schools to raise standards and tackle workload and introduced a set of changes to teachers' conditions of service to be introduced in three annual phases from September 2003:

- 1 September 2003: routine delegation of administrative and clerical tasks, introduction of work/life balance clauses, and introduction of leadership and management time for those with corresponding responsibilities.
- 1 September 2004: introduction of new limits on covering for absent colleagues (38 hours per year).
- 1 September 2005: introduction of guaranteed professional time for planning, preparation and assessment, introduction of dedicated headship time, and introduction of new invigilation arrangements.

Acknowledgements

6. BMRB wishes to thank the range of stakeholders who assisted with the design of the diary survey and for organising the support of the parties and their detailed comments and suggestions. These contributed to the successful mounting of the study.

7. This year, the response rate increased slightly for primary, secondary and special schools, compared with 2006. Above all, BMRB would particularly like to thank all the schools which agreed to co-operate in the study and the teachers who took the time to complete diaries and make themselves available to be interviewed. Without their co-operation the study would not have been possible.

The survey

8. This year's survey was conducted on a basis similar to the previous seven surveys, with diaries being completed during a single week in March 2007. As such, it should be kept in mind that the survey statistics do not necessarily provide an accurate guide to working patterns in other weeks of the year, although an important factor in selecting the week was that it was generally felt not to be unusual for term-time. The achieved sample of 2,151 teachers is an increase on last year's achieved sample.

9. In the 2007 survey, there were some changes to the activity codes and follow-up questionnaire, as compared with the 2006 survey, in order to better represent teachers' activities. For example code T11 in the 2006 survey, "covering absent teacher's lesson within the timetabled day" was split into two new codes: "teaching during cover for absent colleague within timetabled day" and "covering for absent colleague, when cover takes the form of supervising pre-set work". The former of these is categorised as teaching and the latter as non-teaching pupil/parent contact. This change was an attempt to better capture when teachers are actually teaching. This and other changes were made through consultation with key stakeholders and are documented in the survey's technical report which is available on request from OME.

10. As a result of the changes in 2007, grouped breakdowns of workload activities should not be compared directly with earlier surveys, although comparisons of total workload and of individual activities remain valid. Technical notes on the survey are included in Annex B.

11. For more details about the survey, please contact Anthony Craggs at the Office of Manpower Economics (anthony.craggs@berr.gsi.gov.uk).

Chapter 2

SUMMARY OF FINDINGS

Comparisons between 2007 and previous surveys

12. Charts 1 and 2 and Table 1 compares average total hours worked from the 2007 survey with previous years for various categories of teacher. Table 2 gives the same comparison for average hours worked on teaching activities. Tables A1 to A28 in Annex A provide more detailed breakdowns of the survey results.

Hours worked

13. Charts 1 and 2 show the average total hours worked by teachers in primary and secondary schools respectively (detailed figures are set out in Table 1).

Chart 1

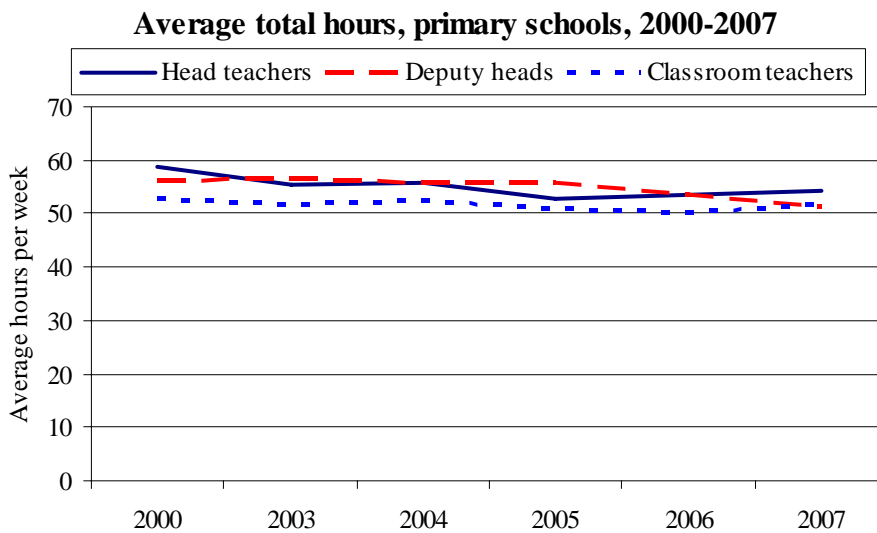

Chart 2

14. The charts show that most categories of teacher in 2007 continued to report working over 50 hours per week. Chart 1 shows that the working hours reported by primary heads, deputies and classroom teachers have decreased since 2000, although the hours reported have fluctuated in the intervening period (e.g. the 2007 estimates for heads and classroom teachers are higher than the 2006 survey). Chart 2 shows a gentle decrease in the number of hours reported by secondary classroom teachers; the number of hours reported by secondary heads and deputies in recent years shows more volatility although this year's estimates are lower than those in previous surveys (see paragraph 15 below).

15. The 2007 survey has seen some statistically significant changes¹ in the reported numbers of hours worked by full-time teachers between 2006 and 2007:

- Secondary head teachers have seen decreases in the total hours worked, from a peak of 65.1 hours in 2006 to 57.6 hours in 2007.
- Secondary deputy heads have seen a decrease in total hours worked between 2006 and 2007 (from 61 hours per week to 53.6 hours).

The estimates of hours worked by secondary head and deputy head teachers are more prone to volatility than those for classroom teachers due to the relatively small sample sizes. Detailed analysis of the hours reported by secondary heads and deputy heads in recent years show that:

- the distribution of hours recorded in the 2006 survey was particularly unusual, with considerably more heads and deputy heads reporting working over 70 hours than in any other year.
- the 2007 survey has seen a return to more 'normal' distribution with relatively few heads and deputy heads at the extremes of the distribution and this partly explains the significant decrease in average hours recorded.

¹ For more explanation of statistically significant changes see paragraphs 16-28 of Annex B.

- for heads the biggest decreases between 2006 and 2007 were reported in the numbers of hours spent on contact with parents/families and on ‘management related activities’ not explicitly captured elsewhere by the survey.

16. As was the case with the results for 2006, there are a number of statistically significant changes when comparing 2007 with earlier years

- Primary heads have seen a decrease in total hours worked, from 58.9 hours per week in 2000 to 54.2 in 2007 (although the 2007 estimate is higher than that for the two previous years).
- Primary deputy heads have seen decreases in total hours worked, from 55.7 hours in 2005, to 51.4 hours in 2007.
- Primary classroom teachers worked fewer hours than in 2004 and 2000. The 2007 estimate of 51.5 hours is, however, slightly higher than those for 2005 and 2006.
- Secondary heads of department have seen a decrease in total hours worked, from 52.7 hours in 2003, to 50.2 hours in 2007.
- Secondary classroom teachers have seen statistically significant decreases in total hours worked, from 50.8 hours per week in 2003 to 48.7 hours in 2007 (the 2006 estimate was 49.1 hours).
- Special classroom teachers have seen a decrease in total hours worked, from 51.2 hours in 2000 to 45 hours in 2007.

Table 1 – Average total hours worked by full-time teachers in a week, 2000-2007

	Total					
	2007	2006	2005	2004	2003	2000
Primary	Hours	Hours	Hours	Hours	Hours	Hours
Head teachers ¹	54.2	53.5	52.9	55.6	55.5	58.9
Deputy heads ²	51.4	53.4	55.7	55.7	56.4	56.2
Classroom teachers ³	51.5	50.1	50.9	52.5	51.8	52.8
Secondary						
Head teachers ⁴	57.6	65.1	62.6	60.8	60.9	60.8
Deputy head ⁵	53.6	61.0	58.1	54.1	56.5	58.6
Heads of faculty/department ⁶	50.2	51.5	51.2	51.6	52.7	52.9
Classroom teachers ⁶	48.7	49.1	49.3	49.9	50.8	51.3
Special						
Classroom teachers ⁷	45.0	43.9	45.6	46.3	47.6	51.2
<p>1. The change in total hours between 2007 and 2000 is statistically significant at the 95% level</p> <p>2. The change in total hours between 2007 and all measures taken from 1996-2005 is statistically significant at the 95% level</p> <p>3. The change in total hours between 2007 and 2004 is statistically significant at the 95% level</p> <p>4. The change in total hours between 2007 and all previous measures taken is statistically significant at the 95% level</p> <p>5. The change in total hours between 2007 and all measures except 2004 is statistically significant at the 95% level</p> <p>6. The change in total hours between 2007 and all measures taken from 2000-2003 is statistically significant at the 95% level</p> <p>7. The change in total hours between 2007 and 2000 is statistically significant at the 95% level</p> <p>Total hours worked include, as in previous years, completing the diary, which takes around an hour on average</p>						

Teaching hours

17. In the 2007 survey, there were some changes to the activity codes and follow-up questionnaire, in order to better represent teachers' activities. For example code T11 in the 2006 survey, "covering absent teacher's lesson within the timetabled day" was split into two new codes: "teaching during cover for absent colleague within timetabled day" and "covering for absent colleague, when cover takes the form of supervising pre-set work". As a result of these changes, some time which would previously have been classed as teaching is now classed as non-teaching. Therefore, a direct comparison of teaching hours between 2007 and the earlier surveys should not be made.

Table 2 Average total teaching hours worked by full-time teachers in a week, 2000-2007

	Teaching					
	2007 ¹	2006	2005	2004	2003	2000
Primary	Hours	Hours	Hours	Hours	Hours	Hours
Head teachers	3.4	4.0	3.8	5.8	4.9	6.0
Deputy heads	13.1	15.2	14.6	14.8	15.9	16.8
Classroom teachers	16.6	17.8	18.1	18.5	18.6	18.8
Secondary						
Head teachers	1.7	2.9	2.8	2.9	2.5	3.4
Deputy head	9.9	9.7	10.2	9.6	10.8	9.6
Heads of faculty/department	17.6	18.6	17.9	18.3	18.1	18.0
Classroom teachers	18.8	19.3	18.9	19.4	19.6	19.4
Special						
Classroom teachers	15.7	15.9	15.5	16.7	16.1	18.4

1. Definition of teaching has changed from previous years: some classroom supervision, which was previously included in the teaching codes, is now classified as non-teaching pupil/parent contact

18. We have, however, calculated teaching hours for 2007 using the definitions used from 2000-2006 (by adding on to the total teaching hours codes P22 "covering for absent colleague, when cover takes the form of supervising pre-set work" and P31 "supervising pupils on educational visits, or while external provider is teaching pupils"). These are reproduced below:

	Teaching					
	2007	2006	2005	2004	2003	2000
Primary	Hours	Hours	Hours	Hours	Hours	Hours
Head teachers	4.4	4.0	3.8	5.8	4.9	6.0
Deputy heads	13.8	15.2	14.6	14.8	15.9	16.8
Classroom teachers	16.9	17.8	18.1	18.5	18.6	18.8
Secondary						
Head teachers	2.0	2.9	2.8	2.9	2.5	3.4
Deputy head	10.5	9.7	10.2	9.6	10.8	9.6
Heads of faculty/department	18.4	18.6	17.9	18.3	18.1	18.0
Classroom teachers	19.5	19.3	18.9	19.4	19.6	19.4
Special						
Classroom teachers	15.9	15.9	15.5	16.7	16.1	18.4

Typically recalculating teaching hours in this way adds between half an hour and an hour to the average teaching hours for each grade.

Perceptions of workload

19. The survey asked teachers a number of questions about their perception of their workload (Table A27). Around 25 per cent of head teachers and 13 per cent of classroom teachers did not respond to these attitudinal questions and this should be borne in mind when interpreting the responses. Key findings were:

- Primary head teachers were more likely to say that they often had to do things which were not directly related to their job: 21 per cent of primary heads said this applied to them all or most of the time, compared with 7 per cent of secondary heads and around 11 per cent of full-time primary and secondary classroom teachers.
- Eighteen per cent of full-time secondary classroom teachers and 16 per cent of full-time primary classroom teachers felt they were unable to do things which should be part of their job all or most of the time, compared with 13 per cent of primary and 10 per cent of secondary teachers.
- Secondary head teachers were more likely to say that their duties represented a good use of their time: 63 per cent of them said that this was true all or most of the time, compared with 36 per cent of primary heads.
- Only 7 per cent of secondary heads felt that their workload allowed them to pursue outside interests all or most of the time, compared with 17 per cent of primary heads, 25 per cent of full-time primary classroom teachers and 31 per cent of full-time secondary teachers.
- The number of primary heads who felt that they had enough time to do their job as it should be done all or most of the time has fallen from 43.5 per cent in 2006 to 34 per cent in 2007. Conversely, the number of secondary heads who felt they had enough time, all or most of the time, to do their jobs has risen from 32 per cent to 45 per cent.

The 2007 survey results

20. Tables A1 to A28 provide detailed tabulations of the survey data. Please note that the tabulations are based on survey estimates and are therefore subject to sampling error (see Annex B1 for more details).

21. The following list summarises the breakdowns of total hours available in the detailed tables:

- Gender and teacher category – Tables A2-A5
(These breakdowns are only provided for those categories of teachers where the sample size for each gender is greater than 50, i.e. heads of department in secondary schools and full-time classroom teachers in primary and secondary schools.)
- Classroom teacher demographics – Tables A6-A8
- Distribution of total hours and teaching hours – tables A9-A17
- Part-time teachers – Table A18
- Special Schools – Tables A19-A20
- Detailed activities – Tables A21-A23
- Weekend and ‘out of hours’ working – Tables A24-A26

Workload activities

22. Analysis of the grouped activities that make up teachers’ workload is summarised in Table A1 (with more detailed analyses in Tables A21-A23). Key findings are:

Teaching

23. Classroom teachers in primary and secondary schools spend, on average, around one third of their working time on teaching activities, with the figure slightly higher in secondary schools than in primaries. Deputy and assistant heads in primary schools spend around a quarter of their working time teaching, compared with under 20 per cent by deputy heads in secondary schools (see Table A1).

Planning, preparation and assessment

24. On average, primary and secondary school classroom teachers spend just over 30 per cent of their working time on planning, preparation, and assessment (Table A1). Secondary school classroom teachers spend less time planning and preparing lessons but the same amount of hours assessing pupil work and writing reports as primary school teachers (Tables A21 and A22).

Non-teaching contact with pupils and parents

25. Teachers in primary and secondary schools spend between 10 per cent (primary classroom teachers) and 17 per cent (secondary deputy heads) of their time on non-teaching contact with pupils and parents (Table A1).

School/staff management

26. Secondary heads spend around seven hours more on school or staff management than primary heads. Heads in both types of school spend over half of their working time on management. Deputy heads in secondary schools spend around 35 per cent of their time on management; the corresponding figure in Primary schools is around 20 per cent (Table A1).

General administrative support

27. For all grades of teacher, the average hours spent on general administrative support tends to be higher in primary schools than in secondary schools (Table A1).

Individual/professional activity

28. On average, heads spend around 10 per cent of their time on individual or professional activities, compared with between 6 and 7 per cent for classroom teachers (Table A1).

Weekend and evening work

29. On average, full-time teachers in primary schools worked between 6 and 10 per cent of their hours at weekends. In secondary schools, the averages are ranged from 7 to 12 per cent. A further 14 to 18 per cent of hours worked in primary and secondary schools were worked after 6.00 pm, or before school starts, on weekdays (Table A24).

30. Around two-thirds of teachers' out of school hours work is spent on planning, preparation and assessment. The remaining time is predominantly taken up with other administrative and individual/professional activities (Table A25).

SURVEY RESULTS

Table

A1	Average hours worked by full-time teachers, in total and on grouped activities
A2	Average hours worked by full-time heads of department in secondary schools
A3	Average hours worked by full-time classroom teachers
A4	Average hours worked by full-time classroom teachers with management allowance
A5	Average hours worked by full-time classroom teachers without management allowance
A6	Average total hours worked by full-time classroom teachers in primary schools by teacher demographics
A7	Average total hours worked by full-time classroom teachers in secondary schools by teacher demographics
A8	Average total hours worked by full-time classroom teachers by school demographics
A9	Distribution of total hours worked by full-time head teachers
A10	Distribution of total hours worked by full-time deputy and assistant head teachers
A11	Distribution of total hours worked by full-time heads of department in secondary schools
A12	Distribution of total hours worked by full-time classroom teachers
A13	Distribution of total hours worked by full-time classroom teachers with management allowance
A14	Distribution of total hours worked by full-time classroom teachers without management allowance
A15	Distribution of teaching hours worked by full-time classroom teachers
A16	Distribution of teaching hours worked by full-time classroom teachers with management allowance
A17	Distribution of teaching hours worked by full-time classroom teachers without management allowance
A18	Average hours worked by part-time classroom teachers
A19	Average hours worked by full-time teachers in special schools
A20	Distribution of total hours, and of teaching hours, worked by full-time classroom teachers in special schools
A21	Average hours spent on individual activities by full-time head teachers, deputy and assistant head teachers and classroom teachers in primary schools
A22	Average hours spent on individual activities by full-time head teachers, deputy and assistant head teachers, heads of department and classroom teachers in secondary schools
A23	Average hours spent on individual activities by full-time classroom teachers in special schools

- A24 Percentage of total hours worked by full-time teachers at weekends, and before school or after 6 p.m. on weekdays
- A25 Composition of hours worked at weekends, before school and after 6 p.m. for full-time classroom teachers
- A26 Relationship of total hours worked to hours worked at weekends, before school and after 6 p.m. for full-time classroom teachers
- A27 General attitudes of teachers to their jobs and workloads
- A28 Average total hours, teaching hours and hours worked at weekends, before school and after 6 p.m. for full-time classroom teachers, by the teacher's view of "how much of the time it was possible to do the job as it should be done"

Notes on tables in Annex A

All tables are based on weighted data.

All bases are unweighted unless otherwise stated.

The following conventions have been used:

- nil
- * a non-zero value of less than 0.5% or of less than 0.05 hours
- () Less reliable because of low sample numbers, i.e. fewer than 50

Table A1 - Average hours worked by full-time teachers, in total and on grouped activities

(a) those giving no answer are included in the total but not the breakdown; unweighted sample numbers

(b) Omitted because of low sample numbers

Annex B1

TECHNICAL NOTES

Fieldwork

1. All sampled schools were sent an advance letter from BMRB informing them of the survey and asking for their co-operation. The advance letter was accompanied by a letter from the Chairman of the School Teachers' Review Body and the main teaching unions giving further information about the purpose of the survey.

2. BMRB interviewers arranged to visit each school. At that visit, they carried out a short interview with the head teacher and distributed pre-prepared survey packs within the school, placed personally with teachers wherever possible. At the same time, further appointments were made to undertake individual interviews with as many participating teachers as possible, in the week after the diaries had been completed. These follow-up interviews were designed in part to resolve any difficulties or queries arising from the diary, as well as serving to ensure that diaries were collected promptly.

Quality control

3. The results from the survey form a large and complex database of records relating to schools, teachers and working days. BMRB employed extensive data processing and checking procedures. Initial checks took place in the follow-up interview, at which obvious gaps or errors were corrected, where possible, in consultation with the appropriate teacher. Subsequently, a comprehensive edit specification, agreed with the OME, was used as the basis for extensive manual and computer editing. Careful checks were carried out for missing or conflicting information about start-times and durations of activities, missing activity codes, etc, and controlled editing undertaken where necessary to ensure the data conformed to basic design rules. On the whole, the quality of the data provided by teachers was good, although the volume of data produced an extensive editing task.

Sample design

4. The Teachers' Workload survey uses a multi-stage stratified random sample with clustering. It is drawn from a comprehensive listing of all schools in England and Wales, provided by the Department for Children, Schools and Families and the National Assembly for Wales. Sampling involves stratifying schools by type (and within primary only, by size). Schools within each stratum were then selected using different sampling schemes within different strata. Head teachers were selected from each school with certainty and the remaining teachers were selected with different probabilities, depending on the size of the school, with up to 14 teachers being selected in addition to the head teacher. The survey departs from Simple Random Probability Sampling (SRS) through the stratification of school types; clustering of teachers within schools; unequal selection probabilities, both of schools and teachers; and also the use of systematic sampling without replacement.

5. Tables B1.1 to B1.3 set out the drawn sample (i.e. the sample of schools approached to participate in the survey).

Table B1.1 **Primary schools**

Area	Number of schools		
	15 teachers or fewer	16 teachers or more	Total
London	2	13	15
Metropolitan	18	21	39

TOTAL	460	221	48%	2814	2270	2151	76%

(a) – only in schools which cooperated

7. The overall school response rate was higher in 2007 than in the 2006 survey, at 48 per cent compared with 43 per cent. This rise was largely accounted for by response in the primary and special sectors, with the overall response rate for primary schools up from 54 per cent to 64 per cent, and the response rate for special schools up from 70 per cent to 80 per cent. The response rate in secondary schools also increased from 33% to 35%.

8. The response rate in London, particularly that in secondary schools, is below the response rate achieved for other parts of the country, and hence could introduce non-response bias into the overall survey results. Detailed analysis shows that the average number of hours worked by the various categories of teacher in London can vary when compared with teachers outside London. The survey data have been weighted to the population of teachers in different areas to ensure that schools from different regions (including London) and different phases (primary, secondary, special) are properly represented in the overall results. However, if schools responding to the survey have different characteristics from those not responding then the results could be affected by some non-response bias. This has not been directly measured.

9. Some returned diaries were classified as unusable. Those excluded from the analysis included any where the teacher was absent for a day or more due to illness, or where he or she had not fully completed the diary for other reasons. The results are therefore based on a final sample of 2,151 teachers (up from 2,003 in 2006). The small proportion of excluded teachers was spread widely across the sample and their omission does not have any noticeable effect on the sample structure or its representation of teachers as a whole.

Diary completion

10. Overall, the diaries were well completed. However, some effects of the diary design and of the accuracy of completion should be noted.

11. The diary asked teachers to record the duration of each activity they carried out but, to avoid constant 'clock watching' and to ease completion, suggested that a minimum activity length of about 5 to 10 minutes be

used unless the teacher considered that the activity warranted a separate entry. Activities which normally occupy very short time periods will, therefore, tend to be under-represented in the analyses but, as each day's diary covered a continuous period from the start of the first working activity to the end of the last, the time occupied by such activities will be included in the total worked either under another specific heading or under "not allocated".

12. Teachers were also asked to record only their main activity if two or more activities took place simultaneously. This again may have altered the balance of time distribution in favour of activities which last for longer periods. However, teachers were asked to split the recording of an activity if there was an interruption (e.g. talking to a parent) or if another activity was carried out. Some teachers occasionally entered two or more activities against a period of work and these are shown as multi-coded activities.

13. Some teachers did not adhere to the rule that the diary should account for all the time between the first and the last work-related activity on each of the seven days. From a detailed inspection of a number of diaries in which there were gaps in the time recorded, from notes written in by the teachers, from checking against the start and end times of the school day and from the experience of earlier surveys, it was clear that such teachers had omitted their "own time", particularly at the start of the diary week and at the weekend. In the preparation of the data, additional entries were inserted to account for any gaps. Where the gap occurred at the weekend, ended before the start of the school day, started after the end of the school day or was wholly within the school lunch break or other breaks, the entry has been coded as "own time". Other missing time periods, which were within school hours or included the start or end times of the school day or of the lunch break, have been treated as "not allocated", together with those activities for which the teacher did not enter an activity code.

Classification of teachers to analysis categories

14. For purposes of analysis, teachers have been grouped by a number of attributes: some of these relate to the school (e.g. its size in terms of pupils, or its type of catchment area); others to the teachers as individuals (e.g. their age or length of service); and others to their circumstances within the school (e.g. the year group taught, or the number of pupils in their class). All these attributes were obtained explicitly from the former DfES/National Assembly for Wales, the head teacher or the individual teachers.

Weighting

15. The results have been re-weighted, to account for the different sampling fractions and different response rates between types of school and region, in order to have a representative sample. The re-weighting also accounts for the numbers of each type of teacher responding, compared to the overall numbers in all schools. All the tables in Annex A are based on the re-weighted results, while sample sizes are given as unweighted figures (ie the actual number of usable responses).

Estimates of precision

16. Because the Teachers' Workloads Diary Survey is based on a *sample* of teachers and not the whole teacher population, the results are liable to differ to some degree from those that would have been obtained if every single teacher had been covered. We can make some assessment of sampling variability, that is the differences in hours worked between the teachers in the sample and in the whole population that arise from random chance. The degree of possible measurement error depends on both the sample size and on how widely estimates of hours worked vary between teachers. This 'sampling error' is likely to be smallest for categories of teacher with a large sample and whose reported hours do not vary greatly. Conversely, it is likely to be largest where sample sizes are small and the numbers of hours reported vary considerably.

Design Effects and Standard Errors

17. Due to the complex sampling design used, the margins of error associated with the survey estimates are likely to be larger than if a simple random sample (SRS) design had been used. To take account of this, Design Effects (DEFFs) have been calculated for the most important estimates. The Design Effect is the ratio of the variance under the complex sample design to the variance of a SRS design.

18. While stratification will tend to decrease the variance, unequal selection probabilities (design weighting) and clustering will both tend to increase it. Generally most overall design effects for surveys with complex sample designs, such as this one, are greater than one.

19. For this survey, Design Effect and complex Standard Error calculations for key measures have been undertaken using STATA statistical software and employing the “Taylor Series” or “Taylor Linearization” method. These calculations take account of the design of the sample and the achieved sample sizes (and resultant weighting) within strata.

Confidence Intervals

20. We can use the resultant Standard Errors to assess what the margins of error (‘confidence intervals’) are likely to be around the survey’s key estimates. It is common when quoting confidence intervals to refer to the 95% confidence interval around a survey estimate. This is calculated as 1.96 times the Standard Error on either side of the estimated percentage or mean since, under a normal distribution, 95% of values lie within 1.96 standard errors of the mean value. If it were possible to repeat the survey under the same conditions many times, 95% of these confidence intervals would contain the population values but, when assessing the results of a single survey, it is usual to assume that there is only a 5% chance that the true population value falls outside the 95% confidence interval calculated for the survey estimate.

21. We can therefore establish the interval as $\bar{x} \pm 1.96$ SEs (where \bar{x} represents the mean obtained from the survey). Taking an example from the 2007 survey, the confidence interval for the average total hours worked by Primary School Heads in 2007 is:

$$\begin{aligned}\bar{x} \pm 1.96 \text{ SE} &= 54.2 \text{ hours} \pm (1.96 * 1.22 \text{ hours}) \\ &= 54.2 \text{ hours} \pm 2.4 \text{ hours}\end{aligned}$$

In summary, although the survey provides our best estimate ($\bar{x} = 54.2$ hours) of the population mean, statistical theory can be used to show we can be very confident that the true population mean lies between 51.8 and 56.6 hours.

Measuring whether differences between surveys are real

22. Once the complex Standard Errors have been calculated, a survey estimate, e.g. the average (mean) total hours worked per week, can be compared with the corresponding estimate from a previous survey to test whether any difference in their values is statistically significant. To undertake this comparison, we conduct ‘Hypothesis Tests’.

23. To illustrate this, let us take an example of the estimated average total hours by Primary Head Teachers in 2000 (58.9 hours) and 2007 (54.2 hours). Using the language of hypothesis testing, let us say that we want to test the ‘null hypothesis (H_0)’ that the difference between the two population means for which we have these estimates is zero, i.e. that there is no true difference between them. The ‘alternative hypothesis (H_1)’ is that there *is* a difference between the population means.

There are four possibilities that might arise when we draw our conclusions.

1. The null hypothesis is correct (there is no true difference) and we correctly conclude this.
2. The null hypothesis is correct (there is no true difference) but we incorrectly conclude otherwise. Hence, an error is made.
3. The null hypothesis is incorrect (there is in fact a difference) and we correctly conclude this.
4. The null hypothesis is incorrect (there is in fact a difference) and we incorrectly conclude otherwise. Hence, an error is made.

In possibilities 1 and 3 we reach the correct conclusions. In possibility 2, we erroneously reject the null hypothesis – this is referred to as a *Type I error*. In possibility 4, we erroneously accept the null hypothesis – this is referred to as a *Type II error*.

24. Statistical hypotheses are statements concerning *population* parameters but we are working here with sample estimates for those parameters. Therefore, the question we are asking is whether we are willing to

attribute the difference between the two sample means to chance. If, on the basis of our test, we find that the difference is too large to attribute to chance, then we can conclude that the *populations* from which the samples were drawn have unequal means.

25. Returning to our example, the surveys estimates are as follows:

Average total working hours of Primary Heads

	Mean	Complex Std error
2000	58.9	0.67
2007	54.2	1.42
Difference between years	4.7	1.57 (SE of the difference)

We are prepared to run a 5 per cent risk of incorrectly rejecting the null hypothesis (a Type 1 error) that the population means in the respective years were the same. If we refer to the mean total hours working of *all* Primary Heads (i.e. the *population* mean) in 2000 and 2007 as μ_1 and μ_2 respectively, the hypotheses to be tested are:

$$H_0: \mu_1 - \mu_2 = 0$$

$$H_1: \mu_1 - \mu_2 \neq 0$$

26. Having set the risk of a Type 1 error at 5 per cent, we turn to the decision rule (based on the appropriate random sampling distribution). The test is two-tailed, because the hypothesis of equal population means will be rejected if $\bar{x}_1 - \bar{x}_2$ differs significantly from zero by lying sufficiently far above or below it. For a significance level of 5 per cent, we will reject the null hypothesis if the sample difference $\bar{x}_1 - \bar{x}_2$ falls more than 1.96 Standard Errors* from the expected value of zero.

*The standard error of the difference between the means

The test statistic we employ is z (the difference between the sample means divided by the standard error of that difference)

In terms of z values, the decision rule can be stated:

$$\text{If } z < -1.96 \text{ or } z > 1.96 \text{ reject } H_0$$

Applying the decision rule to our example, we have

$$z = \frac{4.7}{1.57} = 2.99$$

27. Because 2.99 exceeds 1.96, the null hypothesis is rejected. Hence it is extremely unlikely that these two samples represent populations with the same mean. In terms of the example, we conclude that the 2007 survey estimate of 54.2 hours represents a statistically significant change from the 2000 survey figure of 58.9 hours.

28. Significant changes in key estimates between 2007 and earlier years are included in Table 1.
